"In this work, when it shall be found that much is omitted, let it not be forgotten that much likewise is performed..."

SAMUEL JOHNSON, A.M.

From last paragraph of Preface to his two-volume *Dictionary of the English Language*. Vol. I, page 5, 1755, London, Printed by Strahan.

Foreword

In 1957, the Thermophysical Properties Research Center (TPRC) of Purdue University, under the leadership of its founder, Professor Y. S. Touloukian, began to develop a coordinated experimental, theoretical, and literature review program covering a set of properties of great importance to science and technology. Over the years, this program has grown steadily, producing bibliographies, data compilations and recommendations, experimental measurements, and other output. The series of volumes for which these remarks constitute a foreword is one of these many important products. These volumes are a monumental accomplishment in themselves, requiring for their production the combined knowledge and skills of dozens of dedicated specialists. The Thermophysical Properties Research Center deserves the gratitude of every scientist and engineer who uses these compiled data.

The individual nontechnical citizen of the United States has a stake in this work also, for much of the science and technology that contributes to his well-being relies on the use of these data. Indeed, recognition of this importance is indicated by a mere reading of the list of the financial sponsors of the Thermophysical Properties Research Center; leaders of the technical industry of the United States and agencies of the Federal Government are well represented.

Experimental measurements made in a laboratory have many potential applications. They might be used, for example, to check a theory, or to help design a chemical manufacturing plant, or to compute the characteristics of a heat exchanger in a nuclear power plant. The progress of science and technology demands that results be published in the open literature so that others may use them. Fortunately for progress, the useful data in any single field are not scattered throughout the tens of thousands of technical journals published throughout the world. In most fields, fifty percent of the useful work appears in no more than thirty or forty journals. However, in the case of TPRC, its field is so broad that about 100 journals are required to yield fifty percent. But that other fifty percent! It is scattered through more than 3500 journals and other documents, often items not readily identifiable or obtainable. Nearly 50,000 references are now in the files.

Thus, the man who wants to use existing data, rather than make new measurements himself, faces a long and costly task if he wants to assure himself that he has found all the relevant results. More often than not, a search for data stops after one or two results are found--or after the searcher decides he has spent enough time looking. Now with the appearance of these volumes, the scientist or engineer who needs these kinds of data can consider himself very fortunate. He has a single source to turn to; thousands of hours of search time will be saved, innumerable repetitions of measurements will be avoided, and several billions of dollars of investment in research work will have been preserved.

However, the task is not ended with the generation of these volumes. A critical evaluation of much of the data is still needed. Why are discrepant results obtained by different experimentalists? What undetected sources of systematic error may affect some or even all measurements? What value can be derived as a "recommended" figure from the various conflicting values that may be reported? These questions are difficult to answer, requiring the most sophisticated judgment of a specialist in the field. While a number of the volumes in this Series do contain critically evaluated and recommended data, these are still in the minority. The data are now being more intensively evaluated by the staff of TPRC as an integral part of the effort of the National Standard Reference Data System (NSRDS). The task of the National Standard Reference Data System is to organize and operate a comprehensive program to prepare compilations of critically evaluated data on the properties of substances. The NSRDS is administered by the National Bureau of Standards under a directive from the Federal Council for Science and Technology, augmented by special legislation of the Congress of the United States. TPRC is one of the national resources participating in the National Standard Reference Data System in a united effort to satisfy the needs of the technical community for readily accessible, critically evaluated data.

As a representative of the NBS Office of Standard Reference Data, I want to congratulate Professor Touloukian and his colleagues on the accomplishments represented by this Series of reference data books. Scientists and engineers the world over are indebted to them. The task ahead is still an awesome one and I urge the nation's private industries and all concerned Federal agencies to participate in fulfilling this national need of assuring the availability of standard numerical reference data for science and technology.

EDWARD L. BRADY
Associate Director for Information Programs
National Bureau of Standards

Preface

Thermophysical Properties of Matter, the TPRC Data Series, is the culmination of twelve years of pioneering effort in the generation of tables of numerical data for science and technology. It constitutes the restructuring, accompanied by extensive revision and expansion of coverage, of the original *TPRC Data Book*, first released in 1960 in loose-leaf format, 11" × 17" in size, and issued in June and December annually in the form of supplements. The original loose-leaf *Data Book* was organized in three volumes: (1) metallic elements and alloys, (2) nonmetallic elements, compounds, and mixtures which are solid at N.T.P., and (3) nonmetallic elements, compounds, and mixtures which are liquid or gaseous at N.T.P. Within each volume, each property constituted a chapter.

Because of the vast proportions the *Data Book* began to assume over the years of its growth and the greatly increased effort necessary in its maintenance by the user, it was decided in 1967 to change from the loose-leaf format to a conventional publication. Thus, the December 1966 supplement of the original *Data Book* was the last supplement disseminated by TPRC.

While the manifold physical, logistic, and economic advantages of the bound volume over the loose-leaf oversize format are obvious and welcome to all who have used the unwieldy original volumes, the assumption that this work will no longer be kept on a current basis because of its bound format would not be correct. Fully recognizing the need of many important research and development programs which require the latest available information, TPRC has instituted a *Data Update Plan* enabling the subscriber to inquire, by telephone if necessary, for specific information and receive, in many instances, same-day response on any new data processed or revision of published data since the latest edition. In this context, the TPRC Data Series departs drastically from the conventional handbook and giant multivolume classical works, which are no longer adequate media for the dissemination of numerical data of science and technology without a continuing activity on contemporary coverage. The loose-leaf arrangements of many works fully recognize this fact and attempt to develop a combination of bound volumes and loose-leaf supplement arrangements as the work becomes increasingly large. TPRC's *Data Update Plan* is indeed unique in this sense since it maintains the contents of the TPRC Data Series current and live on a day-to-day basis between editions. In this spirit, I strongly urge all purchasers of these volumes to complete in detail and return the *Volume Registration Certificate* which accompanies each volume in order to assure themselves of the continuous receipt of annual listing of corrigenda during the life of the edition.

The TPRC Data Series consists initially of 13 independent volumes. The initial ten volumes will be published in 1970, and the remaining three by 1972. It is also contemplated that subsequent to the first edition, each volume will be revised, updated, and reissued in a new edition approximately every fifth year. The organization of the TPRC Data Series makes each volume a self-contained entity available individually without the need to purchase the entire Series.

The coverage of the specific thermophysical properties represented by this Series constitutes the most comprehensive and authoritative collection of numerical data of its kind for science and technology.

Whenever possible, a uniform format has been used in all volumes, except when variations in presentation were necessitated by the nature of the property or the physical state concerned. In spite of the wealth of data reported in these volumes, it should be recognized that all volumes are not of the same degree of completeness. However, as additional data are processed at TPRC on a continuing basis, subsequent editions will become increasingly more complete and up to date. Each volume in the Series basically comprises three sections, consisting of a text, the body of numerical data with source references, and a material index.

The aim of the textual material is to provide a complementary or supporting role to the body of numerical data rather than to present a treatise on the subject of the property. The user will find a basic theoretical treatment, a comprehensive presentation of selected works which constitute reviews, or compendia of empirical relations useful in estimation of the property when there exists a paucity of data or when data are completely lacking. Established major experimental techniques are also briefly reviewed.

The body of data is the core of each volume and is presented in both graphical and tabular formats for convenience of the user. Every single point of numerical data is fully referenced as to its original source and no secondary sources of information are used in data extraction. In general, it has not been possible to critically scrutinize all the original data presented in these volumes, except to eliminate perpetuation of gross errors. However, in a significant number of cases, such as for the properties of liquids and gases and the thermal conductivity of all the elements, the task of full evaluation, synthesis, and correlation has been completed. It is hoped that in subsequent editions of this continuing work, not only new information will be reported but the critical evaluation will be extended to increasingly broader classes of materials and properties.

The third and final major section of each volume is the material index. This is the key to the volume, enabling the user to exercise full freedom of access to its contents by any choice of substance name or detailed alloy and mixture composition, trade name, synonym, etc. Of particular interest here is the fact that in the case of those properties which are reported in separate companion volumes, the material index in each of the volumes also reports the contents of the other companion volumes.* The sets of companion volumes are as follows:

Thermal conductivity:	Volumes 1, 2, 3
Specific heat:	Volumes 4, 5, 6
Radiative properties:	Volumes 7, 8, 9
Thermal expansion:	Volumes 12, 13

The ultimate aims and functions of TPRC's Data Tables Division are to extract, evaluate, reconcile, correlate, and synthesize all available data for the thermophysical properties of materials with the result of obtaining internally consistent sets of property values, termed the "recommended reference values." In such work, gaps in the data often occur, for ranges of temperature, composition, etc. Whenever feasible, various techniques are used to fill in such missing information, ranging from empirical procedures to detailed theoretical calculations. Such studies are resulting in valuable new estimation methods being developed which have made it possible to estimate values for substances and/or physical conditions presently unmeasured or not amenable to laboratory investigation. Depending on the available information for a particular property and substance, the end product may vary from simple tabulations of isolated values to detailed tabulations with generating equations, plots showing the concordance of the different values, and, in some cases, over a range of parameters presently unexplored in the laboratory.

The TPRC Data Series constitutes a permanent and valuable contribution to science and technology. These constantly growing volumes are invaluable sources of data to engineers and scientists, sources in which a wealth of information heretofore unknown or not readily available has been made accessible. We look forward to continued improvement of both format and contents so that TPRC may serve the scientific and technological community with ever-increasing excellence in the years to come. In this connection, the staff of TPRC is most anxious to receive comments, suggestions, and criticisms from all users of these volumes. An increasing number of colleagues are making available at the earliest possible moment reprints of their papers and reports as well as pertinent information on the more obscure publications. I wish to renew my earnest request that this procedure becomes a universal practice since it will prove to be most helpful in making TPRC's continuing effort more complete and up to date.

It is indeed a pleasure to acknowledge with gratitude the multisource financial assistance received from over fifty of TPRC's sponsors which has made the continued generation of these tables possible. In particular, I wish to single out the sustained major support being received from the Air Force Materials Laboratory–Air Force Systems Command, the Office of Standard Reference Data–National Bureau of Standards, and the Office of Advanced Research and Technology-National Aeronautics and Space Administration. TPRC is indeed proud to have been designated as a National Information Analysis Center for the Department of Defense as well as a component of the National

*For the first edition of the Series, this arrangement was not feasible for Volume 7 due to the sequence and the schedule of its publication. This situation will be resolved in subsequent editions.

Standard Reference Data System under the cognizance of the National Bureau of Standards.

While the preparation and continued maintenance of this work is the responsibility of TPRC's Data Tables Division it would not have been possible without the direct input of TPRC's Scientific Documentation Division and, to a lesser degree, the Theoretical and Experimental Research Divisions. The authors of the various volumes are the senior staff members in responsible charge of the work. It should be clearly understood, however, that many have contributed over the years and their contributions are specifically acknowledged in each volume. I wish to take this opportunity to personally thank those members of the staff, research assistants, graduate research assistants, and supporting graphics and technical typing personnel without whose diligent and painstaking efforts this work could not have materialized.

Introduction to Volume 1

This volume of *Thermophysical Properties of Matter*, the TPRC Data Series, is perhaps the most comprehensive of all the volumes of the Series. Indeed, it is the result of one of TPRC's oldest data tables programs, initiated in 1959.

The volume comprises three major sections: namely, the front text material together with its bibliography, the main body of numerical data and its references, and the material index.

The text material is intended to assume a role complementary to the main body of numerical data which is the primary purpose of this volume. It is felt that a moderately detailed discussion of the theoretical nature of the property under consideration together with a review of predictive procedures and recognized experimental techniques will be appropriate in a major reference work of this kind. The extensive reference citations given in the text should lead the interested reader to sufficient literature for a detailed study. It is hoped, however, that enough detail is presented for this volume to be self-contained for the practical user.

The main body of the volume consists of the presentation of numerical data compiled over the years in a most comprehensive and meticulous manner. The scope of coverage includes the metallic elements and most metallic alloys and intermetallic compounds of engineering importance. The extraction of all data directly from their original sources ensures freedom from errors of transcription. Furthermore, some gross errors appearing in the original source documents have been corrected. The organization and presentation of the data together with other pertinent information in the use of the tables and figures are discussed in detail in the section entitled *Numerical Data*.

The part of the data tables covering the elements deserves special mention. We wish to point out that the extensive original literature data from near absolute zero to past the melting point have been critically reviewed and analyzed, and "recommended reference values" are presented.

Such recommended values are those that were considered to be the most probable when assessments were made of the information available in late 1968. Their inclusion adds a unique feature that is designed to provide the user with acceptable values. It should be realized, however, that these recommended values are not necessarily the final true values and that changes directed toward this end will often become necessary as more data become available. Future editions will contain these changes and will provide similar recommendations made for an increasing number of materials.

As stated earlier, all data have been obtained from their original sources and each data set is so referenced. TPRC has in its files all documents cited in this volume. Those that cannot readily be obtained elsewhere are available from TPRC in microfiche form.

The material index at the end of the volume covers the contents of all three companion volumes (Volumes 1, 2, and 3) on thermal conductivity. It is hoped that the user will find these comprehensive indices helpful.

This volume has grown out of activities made possible, initially by TPRC's Founder Sponsors, and, since 1960, through the principal support of the Air Force Materials Laboratory—Air Force Systems Command, under the monitorship of Mr. John H. Charlesworth. The effort to make critical assessment of the data for the elements was made possible through the support of the Office of Standard Reference Data—National Bureau of Standards, under the monitorship of Dr. Howard J. White, Jr. Over the past ten years, many graduate students and research assistants have rendered assistance for varying periods under the authors' supervision. We wish to acknowledge in chronological order of their association with TPRC, the contributions of Messrs. K. H. Chu, C. Y. Wang, A. Cezairliyan, K. C. Lin, D. Y. Nee, R. L. Feng, J. J. G. Hsia, M. Mangkornkanok, M. Nalbantyan, G. K. Kirjilian, and Mrs. E. K. C. Lee, and Mr. K. Y. Wu. The

two last mentioned are still at TPRC and participated in the final organization of the tables and figures and the demanding task of checking of details. We wish also to acknowledge the benefit of extensive discussions with Dr. J. Kaspar, Senior Staff Scientist, Materials Sciences Laboratory, Aerospace Corporation, and with Dr. A. Cezairliyan, Physicist, National Bureau of Standards. They are, respectively, Visiting Research Professor and Consultant at TPRC.

Inherent to the character of this work is the fact that in the preparation of this volume, we have drawn most heavily upon the scientific literature and feel a debt of gratitude to the authors of the referenced articles. While their often discordant results have caused us much difficulty in reconciling their findings, we consider this to be our challenge and our contribution to negative entropy of information, as an effort is made to create from the randomly distributed data a condensed, more orderly state.

While this volume is primarily intended as a reference work for the designer, researcher, experimentalist, and theoretician, the teacher at the graduate level may also use it as a teaching tool to point out to his students the topography of the state of knowledge on the thermal conductivity of metals. We believe there is also much food for reflection by the specialist and the academician concerning the meaning of "original" investigation and its "information content."

The authors and their contributing associates are keenly aware of the possibility of many weaknesses in a work of this scope. We hope that we will not be judged too harshly and that we will receive the benefit of suggestions regarding references omitted, additional material groups needing more detailed treatment, improvements in presentation or in recommended values, and, most important, any inadvertent errors. If the *Volume Registration Certificate* accompanying this volume is returned, the reader will assure himself of receiving annually a list of corrigenda as possible errors come to our attention.

Theory of Thermal Conductivity of Metallic Materials

1. INTRODUCTION

Heat in solids is conducted by various carriers: electrons, lattice waves (or phonons), magnetic excitations, and, in some cases, electromagnetic radiation. The total thermal conductivity is additively composed of contributions from each type of carrier. It can be shown that

$$k = \frac{1}{3}\sum_j C_j v_j l_j \qquad (1)$$

where the subscript j denotes the type of carrier, C_j is the contribution of carriers of type j to the specific heat per unit volume, v_j is the velocity of the carrier (we regard the carrier as a particle; if the carrier is a wave, the appropriate velocity is the group velocity), and l_j is a suitably defined mean free path.

The theory of thermal conductivity of solids has been the subject of numerous investigations and several review articles and has constituted a large portion of the material in several books [1-15]. It is the purpose of this introductory text to present the major results of the theory only to the extent to which it is needed by the user of these tables: to caution him as to which results are likely to be structure sensitive and thus likely to vary from specimen to specimen, and to help him to judge which materials are likely to have similar properties and thus to guide him in guessing the thermal conductivities of materials which have not been measured.

The occurrence of a mean free path in equation (1) opens up the possibility that in some cases one cannot uniquely define the thermal conductivity of a material. This happens whenever a carrier mean free path becomes comparable to the smallest external dimension of the specimen. It happens particularly in insulators at low temperatures, because of long phonon mean free paths, and in transparent solids at high temperatures, where photons contribute significantly to heat transport. In metals it is a relatively rare occurrence, to be considered only in the case of very small particles, very thin wires, or superconductors at extremely low temperatures.

The principal carriers of heat in metals are electrons and lattice waves, leading to an overall thermal conductivity

$$k = k_e + k_g \qquad (2)$$

where k_e is the electronic component and k_g the lattice component.

Generally k_g of metals, alloys, and semimetals is of magnitude comparable to the lattice thermal conductivity of insulators of corresponding elastic properties, except at low temperatures (where phonon–electron interaction reduces k_g in metals). The relative importance of k_e and k_g thus depends on the magnitude of k_e. The electronic component often parallels the electrical conductivity (Wiedemann–Franz law), and the electrical conductivity is highest in pure metals, reduced in the case of alloys, and even lower in semimetals and semiconductors.

We thus have, as a rough rule, that in highly conducting metals, i.e., pure metals with room temperature resistivities of up to say 5 $\mu\Omega$ cm, k_e is the dominant component over all or almost all temperatures. For poorly conducting metals of higher resistivity, k_g forms an appreciable component at ordinary temperatures. For alloys of more than 0.5 to 1 percent solute content, k_e is substantially decreased below the value of the parent metal at low temperatures (i.e., below room temperature) where k_g becomes significant, but at higher temperatures k_e approaches the value of pure metals of comparable conductivity. Thus k_g is an important component of alloys below room temperatures; above room temperatures it is important when the parent metal is a poor conductor.

As we consider materials of increasingly poorer conductivity, k_e becomes less important relative to

k_g. In semimetals and degenerate semiconductors k_g and k_e are frequently comparable except at low temperatures, where k_e is small. In most semiconductors the electronic thermal conductivity has to be considered only at elevated temperatures.

Since k_e and k_g behave differently as functions of temperature and with the introduction of imperfections, it is important to know the relative roles of these two carriers if predictions are to be made; unfortunately, it is not always easy to know what fraction of the measured thermal conductivity can be ascribed to each (see, for example, reference [1]).

For purposes of the theory of conduction properties, we distinguish between three temperature regimes: high, intermediate, and low, with rough divisions at temperatures (on the absolute scale) of θ and $\theta/3$ respectively, where θ is the Debye temperature. For our purposes this temperature is related to the upper frequency limit ν_m of the spectrum of lattice waves by $h\nu_m = \kappa\theta$, where h and κ are the Planck and Boltzmann constants, respectively. Roughly speaking, at high temperatures each atom vibrates independently of its neighbors, and the theories of lattice vibration simplify. At low temperatures the vibrations are highly correlated and are best described by elastic waves in a continuum with corresponding simplification. The intermediate regime is somewhat awkward, and theoretical results are obtained by interpolation.

All the carriers have mean free paths which are limited in part by the structural imperfections of the solid and in part by the dynamic imperfections produced by thermal vibrations, so that, for each carrier,

$$1/l = \sum_{(\alpha)} 1/l_{(\alpha)} \tag{3}$$

the summation being over all processes α which scatter the carrier. The theory describing scattering by the thermal vibrations depends on the temperature regime, and this accounts for the different theories to be used for the conduction properties.

Most solids have Debye temperatures θ around 300 K, but atomically heavy solids have lower θ's (well below 200 K for gold and lead), while most light-atom solids (diamond, beryllium) have much higher Debye temperatures.

2. ELECTRONIC THERMAL CONDUCTIVITY

In metals, where the density of electrons is high, the electron gas is highly degenerate, that is, all electron states of energy $E < \zeta$ are filled, ζ being the Fermi energy, all states of $E > \zeta$ are empty, and all conduction properties occur in an energy interval $\zeta \pm 0(\kappa T)$, where $\kappa T \ll \zeta$. Under these circumstances the electronic component of the specific heat $C_e \propto T$. v_e is typically 10^8 cm sec^{-1} and independen of temperature. Thus

$$k_e = \tfrac{1}{3} C_e v_e l_e \propto T l_e \tag{4}$$

and its temperature dependence is governed by the temperature dependence of l_e.

Now the electron mean free path l_e also determines the electrical conductivity. Theories of the electron mean free paths are thus at the same time theories of the electrical conductivity σ of metals, while the thermal and the electrical conductivity are related by the Wiedemann–Franz–Lorenz law

$$k_e/\sigma T = L_0 = \tfrac{1}{3}\pi^2(\kappa/e)^2 \tag{5}$$

where e is the electronic charge. In practical units the Lorenz number L_0 is 2.443×10^{-8} V^2 K^{-2}.

The electron mean free path is limited both by electron scattering by defects (chemical impurities and physical defects) and by the thermal vibrations; for in a perfectly periodic crystal lattice l_e would be infinite. To the extent to which the scattering rates due to different processes are additive,

$$1/l_e = 1/l_0 + 1/l_i(T) \tag{6}$$

where l_0 is the residual mean free path and $l_i(T)$ the intrinsic mean free path. The first term on the right hand side of equation (6) describes scattering of electrons by defects, and varies from specimen to specimen, but is independent of temperature as long as the nature and concentration of defects are not functions of temperature.* The second term describes scattering of electrons by lattice vibrations and varies with temperature. In the simple case when the electron gas is isotropic, i.e., the velocity and apparent density of electrons do not depend upon direction relative to the crystal axes, equation (6) leads to an additivity of the co[illegible]onding electrical and electronic thermal resistivities, i.e.,

$$1/\sigma = \rho = \rho_0 + \rho_i(T) \tag{7}$$

and

$$1/k_e = W_e = W_0 + W_i \tag{8}$$

*An important exception would be the vacancy concentration just below the melting point, which in some metals depends on temperature.

Here ρ_0 is the residual electrical resistivity, varying from specimen to specimen, $\rho_i(T)$ the intrinsic electrical resistivity, and W_0, W_i are corresponding components of the thermal resistivity.

The Wiedemann–Franz–Lorenz law, equation (5), is based on the following requirements:

(a) The electron gas is highly degenerate—this appears to be the case in all metals except possibly some transition metals at elevated temperatures.

(b) The electron mean free path l_e is the same for electrical as for thermal conduction, so that it cancels in the ratio k/σ.

An analysis of the second requirement shows that this is almost always satisfied for defect scattering [1, 2]; hence

$$\rho_0/W_0T = L_0 \qquad (9)$$

The exceptions are some cases of magnetic impurities, where scattering is simultaneously inelastic and anisotropic; even here the departure from (9) is significant only at low temperature, where κT is comparable to the Zeeman level splitting of the impurity.

As regards ρ_i and W_i, these are related by the Wiedemann–Franz–Lorenz law in the high-temperature limit only, while at lower temperatures

$$\rho_i/W_iT = L_i \qquad (10)$$

is generally less than L_0 for reasons given in reference [2]. Generally $L_i < L_0$ and in the limit of low temperatures

$$L_i = \delta(T/\theta)^2 \qquad (11)$$

where the coefficient δ depends on the topology of the Fermi surface.

Explicit theoretical expressions for ρ_i and W_i have been obtained only for the very simplest of models, with the electron gas similar to a gas of free electrons, with spherical energy contours in momentum space, and the underlying crystal structure replaced by a uniform distribution of positive charge to compensate the charge of the electron gas. This model, the "jellium" model [12], thus foregoes any considerations of effects due to crystal structure and the corresponding electronic band structure of real metals. On such a model, using a Debye model for the spectrum of lattice vibrations, one obtains the following low-temperature limits [2]

$$\rho_i \propto T^5, \qquad W_i \propto T^2 \qquad (12)$$

and

$$L_i = \rho_i/W_iT = 7.8\ N_a^{-2/3}(T/\theta)^2 \qquad (13)$$

where N_a is the number of conduction electrons per atom. The electronic thermal resistivity at low temperatures can thus be written in the form

$$W_e = \alpha T^2 + \beta/T \qquad (14)$$

Thus

$$k_e = \frac{1}{\alpha T^2 + \beta/T} \qquad (15)$$

where $\beta = \rho_0/L_0$ depends on the specimen, while α is an intrinsic property of the metal. Equation (15) implies that k_e, and thus the total thermal conductivity of pure metals, should pass through a maximum at low temperatures; the purer the specimen, the higher the maximum conductivity and the lower the temperature at which the maximum occurs.

In order to predict theoretically the magnitude of α, or the magnitude of ρ_i, one would need to predict the strength of the interaction between electrons and lattice waves and the corresponding electron scattering probabilities. This interaction can only be estimated very roughly.

In a similar manner, the ability of fundamental theory to predict the absolute magnitude of β for a given concentration of impurities or other defects is very limited. Since such calculations also predict ρ_0, and since electrical resistivities are measured more readily than thermal conductivities, such calculations are usually classified under electrical resistivity calculations. There is an extensive literature on this subject [12], dealing both with theoretical methods and with the vexing question of determining from experiments the specific resistivity of a given number of physical defects of various kinds (i.e., vacancies, interstitials, dislocations, stacking faults) [16]. Even the specific resistivity (or ρ_0 per atomic percent) of a given species of solute atoms is not a trivial determination.

Generally speaking the theory is well able to predict ρ_0 due to point defects which scatter electrons mainly by virtue of a valence difference (vacancies, solute atoms), but does poorly when distortion effects are important (interstitials, dislocations).

The theoretical equation (15) has been extensively compared with low-temperature experimental data for high-purity metals, and disagreements are found [55–57] in that the power of T for most metals is not 2 but greater, and the coefficient α is not a constant for a metal. Considering the temperature dependence of the coefficient α and the interaction between intrinsic and residual thermal resistivities, equation (15) is modified semiempirically [55–57] to become

$$k_e = \frac{1}{\alpha' T^n + \beta/T} \quad (16)$$

where

$$\alpha' = \alpha''\left(\frac{\beta}{n\alpha''}\right)^{(m-n)/(m+1)}$$

and α'', m, and n are constants for a metal. The value of n lies between 2 and 3 for most metals. Much better agreements are obtained in using equation (16) for fitting experimental data, and this equation has been used extensively for calculating the recommended values presented in this volume for highly conducting elements at temperatures below about 1.5 T_m, with T_m the temperature corresponding to the maximum conductivity k_m of the curve.

At high temperatures the theory becomes simpler in form, though it is still difficult to predict absolute values. The theory predicts in the limit, well above the Debye temperature,

$$\rho_i \propto T$$
$$W_i = \rho_i / L_0 T = W_\infty \quad (17)$$

where W_∞ is a constant. This is essentially a consequence of the fact that, at high temperatures the intrinsic scattering probability, or $1/l_i(T)$, varies as $\langle\epsilon^2\rangle$, the mean square thermal strain, which in turn varies as T.

All this needs qualification if finer details are to be investigated. Thus, for example, thermal expansion as well as high-order interactions might cause deviations from $l_i \propto T^{-1}$, and corresponding deviations of W_i from constancy. There are further deviations of L_i from L_0 at high temperatures, generally small but not entirely negligible, arising from the transport equations [12]. Thus $W_i(T)$ tending to a constant value is a good picture only to a first approximation. Finally the assumption of high degeneracy, i.e., $\kappa T \ll \zeta$, which is required so that $\rho \propto 1/l$ and $W \propto T/l$, becomes questionable in some metals at elevated temperatures (i.e., transition metals, actinides), while in the simpler metals we believe it to be a good assumption right up to the melting point.

Finally, the fact that scattering of electrons by thermal vibrations is proportional to $\langle\epsilon^2\rangle$ enables us to estimate the order of magnitude of point defect scattering in terms of thermal scattering at room temperatures, and thus to estimate ρ_0 and W_0 in terms of the room temperature values of ρ_i and W_i. At room temperature $\langle\epsilon^2\rangle$ is about 0.01 in most solids (depending somewhat on atomic volumes and elastic constants, which are not very variable). If we arbitrarily ascribe scattering by a point defect to be equivalent to unit shear strain over one atomic volume, we find that

$$\rho_0 \simeq (\rho_i)_{RT} c$$
$$W_0 T \simeq (W_i)_{RT} c T_{RT} \quad (18)$$

where $(\rho_i)_{RT}$, $(W_i)_{RT}$ are the room temperature intrinsic resistivities, $T_{RT} \simeq 300$ K, and c is the atomic concentration of point defects in percent. Actual values of ρ_0 and $W_0 T$ deviate from the estimates of equation (18) by factors of up to about 3 either way, but equation (18) is very useful in estimating resistivities due to unknown point defects, and applies to all metals and semimetals irrespective of the details of the band structure.

In addition to the scattering of electrons by defect and by thermal vibrations, it is also possible for the electrons to scatter each other, producing both an electrical and thermal resistivity. These effects seem important mainly in metals of high density of states such as transition metals, and lead to resistivities of the form

$$\rho_{ee} \simeq BT^2$$
$$W_{ee} \simeq DT \quad (19)$$

These effects are thus generally important at low temperatures, where they tend to dominate over the respectively T^5 and T^2 variation of ρ_i and W_i, provided of course that the samples are pure enough so that the residual resistivities ρ_0 and W_0 do not yet dominate at those low temperatures. As transition metals are obtained in increasingly pure form, the need of additional terms of the form (19) in the electrical and thermal resistivity equations is found in more and more cases.

Major results of the theory of electronic thermal conductivity have been briefly presented as above. For detailed theoretical developments and discussions, the reader is referred to the review papers and books cited before and to other papers on this subject [17–66].

3. LATTICE THERMAL CONDUCTIVITY

The thermal vibrations of solids contribute to the thermal conductivity. In insulators this is the only mechanism of heat transport except at elevated temperatures. The theory as it applies to insulators is described in somewhat greater detail in Volume 2. The lattice thermal conductivity of metals is governed by the same theoretical considerations, but a number of cases which occur in insulators are not relevant to metals, so that the present discussion is not as comprehensive. General reviews of lattice thermal conductivity are given in references [1-4]. Individual research papers on the theory of lattice thermal conductivity include [67-132].

The thermal vibrations of a perfect crystal are described in terms of lattice waves which occupy a spectrum of frequencies from the lowest frequencies to some upper limit, ν_m, of the order of 10^{13} Hz. At low frequencies these waves are identical to the elastic waves in the corresponding elastic continuum; at the higher frequencies the atomic structure of the crystal lattice leads to dispersion effects. The corresponding wavelengths range from long waves down to waves of length comparable to the interatomic distances.

These waves are randomly excited in thermal equilibrium and the energy content of the solid is given in terms of the laws of statistical mechanics. The specific heat of solids varies as T^3 at the lowest temperatures and is independent of temperature in the high-temperature regime ($T > \theta$, where $\theta = h\nu_m/\kappa$). The spectral distribution of the specific heat per unit volume as given, to a first approximation, by the Debye theory, is of the form

$$C(\nu)\,d\nu = 9N\kappa\left(\frac{T}{\theta}\right)^3 \frac{x^4 e^x}{(e^x - 1)^2}\,dx \qquad (20)$$

where $x = h\nu/\kappa T$ is a reduced frequency and N the number of atoms per unit volume. This holds for $\nu < \nu_m$; for $\nu > \nu_m$, $C(\nu) = 0$.

The Debye approximation disregards the dispersion of the high-frequency lattice waves, disregards differences of polarization of different lattice waves, and smears out the crystal structure of the solid. The only concession to the discreteness of the lattice is the choice of the cutoff frequency ν_m or the corresponding minimum wavelength $\lambda_m = v\nu_m$, where v is some average sound velocity. It is chosen so that the total number of waves corresponds to the correct number of normal modes ($3N$) which this assembly of N atoms ought to have.

In spite of the obvious inadequacy of the Debye approximation, it is frequently chosen as the basis of discussing thermal conductivity, because the inadequacy of that theory is such that small errors in the theory of the specific heat are usually not too important.

In a perfectly periodic crystal which also obeys perfectly the laws of linear elasticity or Hooke's law (i.e., all restoring forces are linear functions of relative displacements, the elastic energy is a quadratic function of relative displacements), each elastic wave is completely independent of all other elastic waves and maintains forever whatever energy it possesses. Such a crystal could carry a heat current or net flow of elastic energy without a driving force, and would thus have an infinite thermal conductivity.

Real crystals, by virtue of structural defects and deviations from linear elasticity, have lattice waves which continuously interchange energy with each other, so that each lattice wave has a finite mean free path. From equation (1), generalized to take account of the fact that this mean free path $l(\nu)$ is generally a function of the frequency of the lattice wave, ν, the lattice thermal conductivity becomes

$$k_g = \frac{1}{3}\int_0^{\nu_m} C(\nu)v_g l(\nu)\,d\nu \qquad (21)$$

where $v_g = d\nu/d(1/\lambda)$ is the group velocity of the waves, and $C(\nu)$ is the spectral specific heat, given approximately by (20).

The lattice thermal conductivity is thus governed by the mean free path of the lattice waves, in an analogous manner to the electronic conduction properties which are governed by the electron mean free path.

Each individual wave can be regarded as a normal mode (or almost normal mode, if l is finite) of the crystal, and obeys the dynamical equations of a harmonic oscillator. According to the laws of quantum mechanics, the energy of each oscillator is not continuously variable, but an integral number of quanta, each of energy $h\nu$. In fact, this was included in the statistical mechanics leading to (20). Each quantum of energy is called a phonon, and each lattice wave contains an integral number of such phonons. By focusing attention on the phonons, as if they were particles, one can describe the thermal energy of vibration of a crystal as a gas of phonons, and use the concepts of the kinetic theory of gases. This description is completely equivalent to the description in terms of lattice waves, and also leads to (21); it has certain advantages of ease of conceptualization, particularly when we talk of the processes of energy interchange between different waves, which can be regarded as scattering of phonons from one wave into another, or the breaking up of a phonon into other phonons, etc. The final results are equivalent, and the phonon mean free path $l(\nu)$ can be defined in an equivalent manner. We shall use either description according to convenience.

At elevated temperatures in good crystals, the principal process limiting the mean free path is the interchange of energy, or scattering of phonons, due to departures from Hooke's law. A local strain ϵ introduces a fractional change in local sound velocity of $\gamma\epsilon$, where the coefficient γ, a measure of the anharmonicity, is of order unity (frequently $\gamma \simeq 2$). At high temperatures the thermal strain at neighboring atomic sites is almost uncorrelated, and scattering is proportional to $\langle\epsilon^2\rangle$ and, in turn, proportional to T. Thus the intrinsic mean free path varies as

$$l_i \propto 1/T \tag{22}$$

analogously to the similar variation of the electron mean free path [see equation (17)]. This has been pointed out by Debye [67].

There is an important difference, however. The electrons contributing to the conductivity all have a short wavelength, but the lattice waves have a continuous spectrum of wavelengths. A perturbed atomic site, acting as an independent scattering source, would scatter long-wave lattice waves very weakly, and $l(\nu)$ would increase so rapidly with decreasing ν that the thermal conductivity integral, equation (21), would diverge at the low-frequency limit. In fact this model would lead to $l_i(\nu) \propto 1/\nu^4$, and since $C(\nu) \propto \nu^2$ at lowest frequencies [see equation (20)], one can readily appreciate the divergence difficulty. This simple model is thus inadequate at low frequencies. To avoid this difficulty, Peierls [68] set up a theory of the anharmonic interaction between lattice waves, which is the basis of all subsequent theoretical work. The theory resolves the thermal vibrations into their proper spectral components of lattice waves, and treats in detail the interchange of energy between groups of three lattice waves, or breaking up of one phonon into two other phonons (or vice versa), satisfying certain interference conditions between the frequencies and the direction and wavelengths involved. The theory leads, with some approximation, to a variation

$$1/l_i \propto \nu^2 T \tag{23}$$

and avoids the divergence difficulties [3].

In detail, however, the theory is quite complicated, involving not only the strength of the anharmonic interaction γ, which cannot be estimated with accuracy, but also the detailed crystal structure. (An elastic continuum would not have a thermal resistivity.) Nevertheless, rough estimates have been made [3, 79] and the intrinsic thermal resistivity of the lattice component is of the form

$$W_U \simeq U\left(\frac{\mathrm{h}}{\kappa}\right)^3 \frac{\gamma^2}{Ma}\frac{T}{\theta^3} \tag{24}$$

where M is the atomic mass and a^3 the atomic volume. The numerical coefficient U, typically of order 1/3, is somewhat uncertain, and depends on the details of the crystal structure. The major factor controlling the intrinsic lattice conductivity, however, is the Debye temperature. Solids of high θ will generally have higher values of k_t.

The subscript U stands for *Umklapp*, or flip-over; in Peierls' theory the resistive processes are processes in which the phonon interaction is combined with a Bragg reflection of the lattice wave, or Umklapp processes. These are distinct from the "normal" processes, phonon interactions which help establish thermal equilibrium, but do not change the net energy flow associated with the phonon gas. The need to distinguish between these processes and their different role in producing thermal resistivity adds further complexity to the theory, particularly at intermediate temperatures, and makes detailed numerical predictions very difficult.

At low temperatures the thermal resistivity decreases exponentially according to $W_U \propto e^{-\theta/bT}$, where b is a numerical constant, which also depends sensitively on the crystal structure and the dispersion of the high-frequency lattice waves. This exponential temperature variation has been observed in perfect insulators, but in many insulators it is overshadowed by the thermal resistance which arises from the scattering of lattice waves by various defects.

In metals, however, another resistive process usually dominates at low temperatures: scattering of the lattice waves or phonons by the free electrons. This is of course the very same process as the scattering of conduction electrons by lattice waves or thermal vibrations which had been invoked earlier to limit the electronic conduction properties and which gave rise to $\rho_i(T)$ and $W_i(T)$. These interactions limit the phonon mean free path; the corresponding reciprocal mean free path for phonon-electron scattering

$$1/l_{pe}(\nu) \propto \nu \qquad (25)$$

must be added to the other scattering processes according to equation (3) to obtain $l(\nu)$ of equation (21).

The result of this scattering mechanism is that k_g of metals is lower than k_g of insulating crystals of the same elastic properties, particularly at low temperatures, where $k_g \propto T^2$. At high temperatures, however, anharmonic resistive processes dominate, and k_g tends to equal $1/W_U$ and thus varies as $1/T$. The lattice conductivity will thus have some maximum value at intermediate temperatures. This maximum value is usually considerably smaller than that of insulating crystals, and also smaller than k_e of most pure metals. Typical values of k_g at its maximum (which may lie between 20 and 50 K) would not exceed 0.5 W cm^{-1} K^{-1}, while k_e of metals and k_g of insulators may peak at values ranging from tens to hundreds of watt-units.

Equation (25) was based on the assumption that the electrons have such a long mean free path that the lattice wave can interact with individual electrons. If l' is the electron mean free path, this is equivalent to requiring that

$$l' > \lambda \qquad (26)$$

where λ is the wavelength of the lattice wave (or phonon). In alloys, where l' is finite, this relation breaks down for sufficiently long waves, i.e., at sufficiently low temperatures. With l' typically $100a$ for 1 percent impurity and $\lambda \simeq \frac{1}{3} a(\theta/T)$ for the important thermal waves, where a^3 is the atomic volume, equation (26) is barely satisfied at liquid helium temperatures for a 1 percent alloy (a typical minimum concentration at which k_g can still be separated from k and studied).

In the opposite extreme ($l' \ll \lambda$), the lattice wave no longer interacts with individual electrons, but with the electron gas as a whole [83]. The scattering is no longer given by equation (25), but reduced by a factor of order (l'/λ), so that $1/l_{pe}(\nu) \propto \nu^2$ and $k_g \propto T$ instead of T^2, and appropriately increased. This changed temperature dependence is clearly seen in concentrated alloys of $\rho_0 > 10\ \mu\Omega$ cm. But even in more dilute alloys the effect is partially present at liquid helium temperatures and should be more apparent at lower temperatures. A theoretical analysis of these intermediate situations and a comparison with data for the lattice component of alloys has been given by Lindenfeld and Pennebaker [105].

Finally we must consider the scattering of lattice waves by crystal defects or imperfections.

As a rough rule we can state that extended defects contribute to the lattice thermal resistivity, $1/k_g$, most importantly at lowest temperatures (long waves), while point defects make their most important contribution to $1/k_g$ at intermediate temperatures (at temperatures at or above the maximum in k_g).

At low temperatures the frequency dependence of the phonon mean free path is reflected in the temperature dependence of the lattice conductivity. This is readily seen from equation (21), using expression (20) for $C(\nu)$. If $l(\nu) \propto \nu^{-n} \propto T^{-n}x^{-n}$,

$$k_g \propto T^{3-n} \qquad (27)$$

One can show (e.g., reference [3]) that the frequency dependence of $l(\nu)$ depends on the geometry of the imperfections. For point defects $n = 4$, for line defects $n = 3$, and for sheets $n = 2$. Dislocations have a long-range strain field which is responsible for most of the scattering; for dislocations $n = 1$. The additional scattering by the core has a frequency dependence $n = 3$, but it is only a minor component.

At lowest temperatures dislocations are generally the most important imperfections scattering phonons. Since the frequency dependence is the same as that for scattering by electrons, these two resistive processes are additive, so that

$$\frac{1}{k_g} = W_g = W_{ge} + W_{gd} \propto T^{-2} \qquad (28)$$

where W_{ge} is the lattice resistivity due to electrons, and W_{gd} is that due to dislocations. Typically, W_{gd} becomes comparable to W_{ge} for dislocation densities of the order of 10^{10} per cm^2. The lattice thermal conductivity of alloys is thus sensitive to the state of cold work, even though cold work in alloys produces only small fractional changes in ρ_0 and thus only small changes in k_e.

Relation (27) does not hold, strictly speaking, for point defects, where $n = 4$, for if $l \propto 1/\nu^4$ the integral (21) diverges at low frequencies, though the resulting resistivity frequently is of the form $W_{gp} \propto T$. Point defects must always be considered in conjunction with another resistive process—in conjunction with electron scattering at low temperatures, in conjunction with anharmonic interactions at high temperatures, and the corresponding integrals (21) can only be evaluated numerically.

At low temperatures point defects lead to a departure from $k_g \propto T^2$, which becomes progressively larger as the temperature is increased. Around the maximum of k_g they depress the maximum and tend to flatten the curve, and at even higher temperatures they depress the conductivity and lead to a temperature dependence slower than T^{-1}. As a consequence of the properties of equation (21), their resistivity effect increases more slowly than linearly with point defect concentration, and in the limit of high temperatures and high defect concentration c

$$k_g \propto [c(1-c)]^{-1/2} T^{-1/2} \tag{29}$$

This is a result of the fact that in equation (21) point defect scattering leaves the mean free path of the lowest frequencies essentially unchanged.

Quantitative estimates of the strength of the point defect scattering can be made in terms of the difference in mass from that of a normal site and in terms of the volume misfit [3].

Equation (29) assumes absence of any correlation between the position of point defects. Short range order can lead to different frequency dependences and corresponding changes in the temperature dependence of k_g. An extreme case is presented by systematic spatial variations in the concentration, such as, for example, those due to the strain field of dislocations. These impurity atmospheres lead to scattering that simulates the scattering due to the dislocations which control the atmospheres [129].

4. OTHER CASES

With at least two types of carriers responsible for heat transport, and with each of them being limited by several possible mechanisms, thermal conductivity in metals and alloys [133-138] shows a wide range of differing behavior, which the present review cannot cover comprehensively. To add further to the variety, we have to consider other mechanisms of heat transfer and other mechanisms of resistivity, we also have to take into account cases of nondegeneracy of the electron gas, as are found in semimetals and semiconductors [139-158] of high carrier density, and finally we have to consider the thermal conductivity of superconductors [159-184].

Cooperative effects between the magnetic moments arranged in a regular lattice, leading to the concept of spin waves or magnons, can act both as a new mechanism of heat transport, and at the same time as a resistive mechanism of electronic and phonon transport [185-198].

In order for the localized magnetic moments arranged in a lattice to act as a carrier of heat, the magnetic dipoles of neighboring atoms must be coupled together, either by direct magnetic forces, or by indirect effects carried by the medium of the free electrons. Both the electronic magnetic moments and the nuclear magnetic moments can be involved in principle, though the latter would become important only at much lower temperature. The exchange energy is probably a rough criterion of the upper limit of temperature at which these effects need be considered. The rare earths, with their wide variety of magnetic effects, form a group of materials where magnetic effects are no doubt important, but their thermal conductivities are not well understood at present. Ferromagnetic and nearly ferromagnetic transition metals are another group where magnetic effects would be important. We are unable at present to give a comprehensive treatment of this field compactly.

The thermal conductivity of semimetals is understood in principle, but in practice we do not always have enough information to interpret it. There are two practical complications: (1) the electronic and lattice components are comparable and (2) the electronic component does not follow the Wiedemann-Franz-Lorenz law except at low temperatures.

The departure from the Wiedemann-Franz-Lorenz law follows from the lack of degeneracy at higher temperatures, i.e., the density of states, the electron velocity, and the electron mean free path vary as a function of electron energy, and the fractional variation over an energy interval of the order of κT above and below the Fermi energy ζ is not negligible, as it is in the case of the degenerate electron gas of good metals. Rules can be stated concerning the departure of the Lorenz number $k_e/\sigma T$ from L_0 in terms of the functional form of this variation [1]; the trouble is that in many cases we do not have enough information about the electronic band structure of the semimetals to benefit from these rules. Where we have this information, as in the case of graphite, we can make fairly good predictions about the Lorenz number; again in the limit of low temperatures we expect the Lorenz number to tend toward L_0.

Since in many cases we are not certain of the Lorenz number, we do not always know what fraction of the total thermal conductivity should be ascribed to k_e and to k_g.

The same considerations apply to semiconductors. In many cases k_g predominates and semiconductors should be classed as insulators for purposes of thermal conductivity. There are, however, a few cases where k_e is not negligible at higher temperatures. Since in the case of intrinsic semiconductors the Lorenz number can exceed L_0 by a substantial fraction, of order $(G/\kappa T)^2/12$, where G is the band gap energy, the Wiedemann–Franz–Lorenz law is not always a reliable guide in estimating the magnitude of k_e. When $G/\kappa T$ is large, σ and k_e are in any case small, but for intermediate values this enhancement of the Lorenz number, also known as ambipolar diffusion, can be significant [1].

It remains to consider the thermal conductivity of superconductors. Below the transition temperature T_c, a fraction of the conduction electrons rearrange themselves into an ordered state, of zero entropy, which can carry current without electrical resistance, and also exhibits special magnetic properties. This phenomenon of superconductivity can be quenched by a magnetic field; in many cases the required critical field is quite moderate. It is thus possible to measure the thermal conductivity below T_c, not only in the superconducting, but also in the normal state.

In the superconducting state, the electronic component k_e is reduced. The ratio k_{es}/k_{en} is a function of T/T_c; near T_c it also depends on the degree to which $W_{en} = 1/k_{en}$ is composed of intrinsic or defect-induced resistance. At sufficiently low temperatures, where the latter mechanism dominates, k_{es} decreases exponentially as a function of T_c/T.

While k_e is reduced, k_g is often increased in the superconducting state, because one mechanism of lattice thermal resistance, the scattering of phonons by electrons, is reduced. Well below the transition temperature, k_{gs} would be similar in character to k_g of a dielectric solid of corresponding mechanical properties, and be controlled by external boundaries, by lattice imperfections, and, in the case of polycrystalline aggregates, by the grain size.

In the case of pure superconductors, the total thermal conductivity k_s decreases below k_n, joining k_n at T_c; with decreasing temperature it first falls rapidly, reaches a minimum (when k_{gs} becomes appreciable), and then increases again. In that region it is very structure sensitive. Finally k_s reaches a maximum, and decreases again with decreasing temperature. At this lowest temperature k_s should depend on external or grain size, and may also be influenced by dislocations.

Many superconductors form an intimate mixture of normal and superconducting regions, either for geometric reasons or because (in superconductors of the second kind) such a mixed state is inherently more stable. The phase boundaries will then also act to limit the carrier mean free paths, and rather complex dependences on the history of the specimen may ensue. These phenomena are at present only partly understood.

Experimental Determination of Thermal Conductivity

1. INTRODUCTION

In the experimental determination of the thermal conductivity of solids, a number of different methods of measurement are required for different ranges of temperature and for various classes of materials having different ranges of thermal conductivity values. A particular method may thus be preferable over the others for a given material and temperature range, and no one method is suitable for all the required conditions of measurement. The appropriateness of a method is further determined by such considerations as the physical nature of the material, the geometry of samples available, the required accuracy of results, the speed of operation, and the time and funds entailed.

The various methods for the measurement of thermal conductivity fall into two categories: the steady-state and the nonsteady-state methods. In the steady-state methods of measurement, the test specimen is subjected to a temperature profile which is time invariant, and the thermal conductivity is determined directly by measuring the rate of heat flow per unit area and temperature gradient after equilibrium has been reached. In the nonsteady-state methods, the temperature distribution in the specimen varies with time, and measurement of the rate of temperature change, which normally determines the thermal diffusivity, replaces the measurement of the rate of heat flow. The thermal conductivity is then calculated from the thermal diffusivity with a further knowledge of the density and specific heat of the test material.

The primary concern in most methods of measurement is to obtain a controlled heat flow in a prescribed direction such that the actual boundary conditions in the experiment agree with those assumed in the theory. Theoretically, the simplest method to obtain a controlled heat flow is to use a specimen in the form of a hollow sphere with a heater in the center. The heat supplied by the internal heater passes through the specimen in a radial direction without loss. However, in reality it is very difficult to fabricate a spherical heater which produces uniform heat flux in all radial directions. It is also difficult to fabricate spherical specimens and to measure the heat input and the temperature gradient in this experimental arrangement.

A more commonly used method of controlling heat flow in the prescribed direction is the use of guard heaters (combined with thermal insulation in most cases) so adjusted that the temperature gradient is zero in all directions except in the direction of desired heat flow. In most methods of measuring thermal conductivity, a cylindrical specimen geometry ranging from long rod to short disk is utilized, and the heat flow is controlled to be in either the longitudinal (axial) or the radial direction. Thus, most methods can be subdivided into longitudinal and radial heat flow methods, as discussed in more detail later.

Experimental study of the thermal conductivity of solids was started in the eighteenth century. Benjamin Franklin [199] seems first to have pointed out, in 1753, the different ability of different materials "to receive and convey away the heat." He observed materials such as metal and wood to be good or poor conductors of heat by the degree of coldness felt when touched. Fordyce [200] pioneered in 1787 with experiments on the "conducting powers" of pasteboard and iron. The first steady-state *comparative* method for the measurement of the thermal conductivity of solids was suggested by Franklin and carried out by Ingen-Hausz as reported in 1789 [201]. This method was improved by Despretz as reported in 1822 [202], and Despretz's method was later used by Wiedemann and Franz as reported in 1853 [17] to determine the relative thermal conductivity of a number of metals, leading to the postulation of the Wiedemann-Franz law. Since the first steady-state *absolute* method was reported in 1851 by Forbes [203, 204] (see also [205, 206]) and the first nonsteady-state *absolute* method was reported in 1861 by Ångstrom [207], a number of different methods and their variants have been developed over the years. Several general surveys [208–218] are available for the experimental developments of the methods. The mathematical theories of the methods have been reviewed in several books [219–223].

In the sections that follow, the major methods and the extent of their applicability will be briefly described and discussed. For finer details of experimental designs and techniques, the reader is referred to the references given to the individual methods.

In the category of steady-state methods, we will discuss the longitudinal heat flow method, the Forbes' bar method (which is a quasi-longitudinal heat flow method), the radial heat flow method, the direct electrical heating method, the thermoelectrical method, and the thermal comparator method. In the longitudinal and radial heat flow methods, a distinction is made between absolute and comparative methods according to the means of measuring the heat flow. In an absolute method, the rate of heat flow into a specimen is directly determined, usually by measuring the electrical power input to a heater at one end of the specimen. The rate of heat flow out of a specimen may be measured with a flow calorimeter or boil-off calorimeter. With the latter the rate of heat flow is determined by the boil-off rate of liquid, such as water, of known heat of vaporization, while with the former it is determined by the flow rate and temperature rise of a circulating liquid, such as water, of known heat capacity. In a comparative method, the rate of heat flow is usually calculated from the temperature gradient over a reference sample of known thermal conductivity, which is placed in series with the specimen and in which, hopefully, the same heat flow occurs. The methods are further subdivided according to the various specimen geometries.

In the category of nonsteady-state methods, we will discuss the periodic and the transient heat flow methods. According to the direction of heat flow, each of them is also subdivided into longitudinal and radial heat flow methods. Within the transient heat flow methods, we will discuss also the flash method (which is a variant of the longitudinal heat flow method), the line heat source and probe methods (which are variants of the radial heat flow method), the moving heat source method, and two comparative methods.

It is worth noting that some of the methods discussed below are not suitable for good conductors. They may be suitable for poor conductors such as semiconductors and some for materials such as metallic powders and insulators.

2. STEADY-STATE METHODS

A. Longitudinal Heat Flow Methods

In the longitudinal heat flow methods, the experimental arrangement is so designed that the flow of heat is only in the axial direction of a rod (or disk) specimen. The radial heat loss or gain of the specimen is prevented or minimized and evaluated. Under steady-state conditions and assuming no radial heat loss or gain, the thermal conductivity is determined by the following expression from the one-dimensional Fourier–Biot heat-conduction equation [224, 225]:

$$k = \frac{-q\Delta x}{A\Delta T} \tag{30}$$

where k is the average thermal conductivity corresponding to the temperature $(\frac{1}{2})(T_1+T_2)$, $\Delta T = T_2 - T_1$, q is the rate of heat flow, A is the cross-sectional area of the specimen, and Δx is the distance between points of temperature measurements for T_1 and T_2. The different variants of this method are discussed separately below.

a. *Absolute Methods*

(i) *Rod Method.* This method is suitable for good conductors and for all temperatures except for very high temperatures. In fact, this method has been used for almost all measurements below room temperature. The specimen used is in the form of a relatively long rod so as to produce an appreciable temperature drop along the specimen for precise measurement. A source of heat at a constant temperature is supplied at one end of the rod and flows axially through the rod to the other end, where a heat sink at a lower constant temperature is located. The radial heat loss or gain of the rod should be negligible. In order to calculate the thermal conductivity from equation (30), it is necessary to measure the rate of heat flow into and/or out of the rod, the cross-sectional area, the temperatures of at least two points along the rod, and the distance between points of temperature measurements.

For measurements at cryogenic temperatures, radial heat loss does not constitute a serious problem, and thermal insulation and guard heaters are normally not necessary. The measurement is usually made under high vacuum to prevent gas conduction and convection, and a radiation shield surrounding the specimen may be used to minimize radiation losses. The heat issupplied to one end of the specimen by a heating coil of fine resistance wire (which may be wound directly onto the specimen to eliminate contact resistance between heater and specimen) or by a carbon resistor attached to the end. The temperatures may be measured by gas thermometers, vapor-pressure thermometers, thermocouples, resistance thermometers, or magnetic-susceptibility thermometers. General reviews of the low-temperature measurements and experimental techniques have been presented by White [226, 227]. For details of some of the useful low-temperature apparatus the reader may consult references [228–239].

For measurements at high temperatures, heat loss becomes a serious problem because radiant heat transfer increases rapidly with temperature. To prevent radial heat losses, a guard tube surrounding the specimen with controlled guard heaters may be utilized. Insulating powder is usually used to fill the space between the rod specimen and the guard tube, which should have the same temperature distribution along it as does the rod specimen. In fact, as early as 1887, Berget [240, 241] started the use of a guard ring surrounding (and with the same temperature distribution as) the specimen to prevent heat losses.

The rate of heat flow into the specimen may be determined by measuring the power input to a guarded electrical heater at the free end of the rod specimen [242–244], or by measuring the heat flow out of the specimen with a water-flow calorimeter at the low temperature end [245], or by both [246–248]. Temperature measurements are made usually with thermocouples. In order to get correct temperature measurements and to minimize heat conduction along thermocouple leads, the thermocouples should be made of fine wires of low-conductivity alloys, and the leads from the junction should be along isothermal lines.

This method, as used for measurements at high temperatures, has been comprehensively reviewed and discussed by Laubitz [249] and Flynn [250]. Systematic errors in measurements caused by the effects of heat losses, thermal contact resistance, poor thermocouple contacts, and temperature drift have been analyzed by Bauerle [251].

A variation of this method has been used [252–254] in which the specimen heater is located in a cavity at the center of the rod specimen and a heat sink is at each end. A mean value of the temperature gradient established towards the two ends is used for the thermal conductivity calculation.

(ii) *Plate (or Disk) Method.* This method is suitable for poor conductors such as semiconductors and for low-conductivity materials such as compacted metallic powders and insulators. It is similar to the rod method except for the specimen length to width ratio being greatly reduced to a small fraction. This specimen geometry is favorable for measuring poor conductors, because, the smaller the length to width ratio, the smaller is the ratio of lateral heat losses to the heat flow through the specimen, and the shorter is the equilibrium time. The size of specimen used in various apparatus designed for different kinds of materials varies greatly. For apparatus designed to measure semiconductors, the specimen used may be about 1-cm wide [255], while the apparatus for measuring less homogeneous insulating or refractory materials may require a specimen of over 1 foot in width [256].

In this method, the thermal conductivity is also given by equation (30). The rate of heat flow may be determined by the electrical power input to a guarded heater [256–258], by a guarded water-flow calorimeter [259], by a boil-off calorimeter [260–263], or by a heat flow meter [264]. Temperature measurements are made generally with thermocouples inserted in the specimen or embedded in grooves on the specimen surfaces, depending on the materials tested. Lateral heat losses may be prevented either by utilizing guard heaters or by using a large specimen, of which only a relatively small central area is used for measurement. In the first detailed mathematical analysis of the plate method reported in 1898, Peirce and Willson [265] found already that if the radius of the specimen is five times larger than that of the central test section whose thickness equals its radius, the temperature at any point within the central test section would not sensibly differ from the temperature at the corresponding point in an infinite disk of the same thickness and same face temperatures. Further mathematical analyses of the errors due to lateral heat loss in guarded hot plate apparatus have been given in [266–268].

Detailed descriptions of recent apparatus for measurements at cryogenic temperatures can be found in the articles collected in [269], and for measurements at high temperatures in [270]. A comprehensive review of the plate method has been given in [271]. A description of the NBS steam calorimeter apparatus and some useful discussions on this method have also been given in [250].

There are two main kinds of experimental arrangements for the absolute plate (or disk) method: the single-plate system and the twin-plate system. The single-plate system [255, 258–265] requires only one specimen, which is placed between a hot plate and a cold plate, while the twin-plate system [256, 257] requires two similar specimens to be sandwiched between a hot plate in the middle and two cold plates on the outside. The plate method employing the single-plate system was probably first used by Clément, whose experiment on copper was cited by Péclet [272] in 1841. Péclet also used this method to measure the thermal conductivity of copper, and both of them obtained erroneous results. Later improvements on this method have been made by Peirce and Willson [265] and Lees [273] among others. The idea of a twin-plate system was developed by Lees [273] in 1898, but he did not actually adopt the twin-plate system for his plate method in the series of measurements as reported in [273]. However, he used the twin-plate system in his experiments on the effect of pressure on thermal conductivity reported in 1899 [274]. Great improvement on the plate method employing the twin-plate system was made by Poensgen [257] in 1912, who introduced the guard-ring heater to the system as the prototype of the modern guarded hot-plate apparatus.

b. Comparative Methods

In the earliest steady-state comparative method suggested by Franklin and carried out by Ingen-Hausz [201] as reported in 1789, rods of various metals were coated with wax and heated at one end to a common temperature in a bath of hot water or oil. The wax melted over a greater distance on a rod of better conducting material, and under steady-state conditions the ratio of the conductivities of the rods is roughly proportional to the squares of these distances. The modern comparative methods are divided-rod (or cut-bar) method and the comparative plate method as discussed below.

(i) *Divided-Rod (or Cut-Bar) method.* The divided-rod method was originated by Lodge [275] in 1878 and later used by Berget [276], Lees [277], and many others. In this method a reference sample (or samples) of known thermal conductivity is placed in series with the unknown specimen with hopefully the same rate of heat flow through both the reference sample and the specimen. Under such ideal conditions, the thermal conductivity of the specimen is given by

$$k = k_r \frac{A_r(\Delta T/\Delta x)_r}{A(\Delta T/\Delta x)} \tag{31}$$

where the subscript r designates the reference sample.

This method may be divided into two distinct groups: the "long-specimen" type [276, 278, 279] for measuring the thermal conductivity of good conductors, and the "short specimen" type [275, 277, 280–283] for measuring poor conductors.

Comparative methods have the advantages of simpler apparatus, easier specimen fabrication, and easier operation. Their disadvantages include additional measurement errors due to the required additional measurements of temperatures and thermocouple separations, difficulty in matched guarding, and lower accuracy due to the additional uncertainty in the conductivity of the reference sample, due to the conductivity mismatch between specimen and reference sample, and due to the interfacial thermal contact resistance. These have been carefully analyzed by Laubitz [249] and Flynn [250]. Flynn [250] has pointed out that the ASTM standard cut-bar method C408–58 [282] is not well designed, and the data obtained by using this method can be subject to large errors.

(ii) *Plate (or Disk) Method.* This comparative method is suitable for poor conductors and insulators and is similar to the divided-rod method in principle except that the specimen and the reference samples are now flat plates (or disks) sandwiched between a hot and a cold plate. Christiansen [284] was the first to report in 1881 the use of this type of comparative method in which he compared the thermal conductivity of liquids with that of air. Peirce and Willson [265] used this method to measure the thermal conductivity of marble slabs with glass plates as reference material for comparison. Sieg [285] employed the guard ring in his apparatus to prevent lateral heat loss.

c. Combined Method

In using a "combined" method, the apparatus combines the features of both absolute and comparative methods. The rate of heat flow is determined both through a reference sample placed in series with the specimen and simultaneously by a water-flow calorimeter [286–288] or by measuring the electrical power input to a heater [289]. In the measurements reported in [289], a "dual combined" method was employed in which a heater is located at the center of the divided rod between two short specimens with two longer reference samples at the two ends which are cooled by flowing water.

B. Forbes' Bar Method

Forbes' original method [203–206] consists of two separate experiments. The first was termed by Forbes the *statical*, and the second the *dynamical*, or cooling experiment. In the *statical* experiment a square wrought iron bar with 1.25-inch side and 8 feet long was heated at one end by molten lead or solder at a fixed high temperature, and the steady-state temperature distribution along the bar was determined with the surface of the bar losing heat by convection and radiation to a constant-temperature environment. In the *dynamical* or cooling experiment, a similar bar but only about 20 inches long was cooled in the same environment from a high uniform temperature, and the rate of heat loss was determined. From these two experiments, the thermal conductivity may be computed as follows.

Replacing $\Delta x/\Delta T$ in equation (30) by dx/dT, differentiating the resulting equation with respect to x, and rearranging gives

$$k = \frac{1}{A}\frac{dq}{dx}\frac{1}{d^2T/dx^2} \tag{32}$$

The statical experiment provides values for d^2T/dx^2, and the heat loss per unit time per unit length of the bar in the cooling experiment is

$$\frac{dq}{dx} = AC\frac{dT}{dt} \tag{33}$$

where dT/dt is the measured cooling rate and C the specific heat per unit volume.

Hogan and Sawyer [290] have improved this method so that it is not necessary to know the specific heat of the material. They used a thin long rod enclosed in an isothermal furnace. Radial heat loss from the specimen was determined by passing an electric current through the specimen and measuring the electric power required to maintain it at a temperature slightly above that of the furnace. This replaces Forbes' cooling experiment, and it is not necessary to know the specific heat since a steady-state condition is prevailing.

Hogan and Sawyer's method was further improved by Laubitz [291]. In his comprehensive review Laubitz [249] has discussed in detail the generalized Forbes' bar method, including the other major variants currently in use [292–294].

C. Radial Heat Flow Methods

There are several different types of apparatus all employing radial heat flow. The classification is mainly based upon specimen geometry. In the following we will briefly describe the cylindrical, spherical, ellipsoidal, concentric sphere, concentric cylinder, and plate methods. The reader is referred to the references given for the individual methods for finer details. A comprehensive review of radial heat flow methods has been made by McElroy and Moore [295].

a. Absolute Methods

(i) *Cylindrical Method.* The cylindrical method uses a specimen in the form of a right circular cylinder with a coaxial central hole, which contains either a heater or a heat sink, depending on whether the desired heat flow direction is to be radially outward or inward. The use of this method was first reported by Callendar and Nicolson [296] in 1897 for measuring the thermal conductivity of cast iron and mild steel. The cylindrical specimens used were 5 inches in diameter and 2 feet long with 1-inch coaxial holes heated by steam under pressure. The outside of the cylinder was cooled by water circulating rapidly in a spiral tube. Niven [297] in 1905 also used the radial heat flow method for measurements on wood, sand, and sawdust. His method is close to the so-called hot-wire method developed by Andrews [298] in 1840 and Schleiermacher [299] in 1888 for measurements on gases. Kannuluik and Martin [300] used the hot-wire method for measurements on powders as well as on gases.

In the early experiments and also in many later designs [301–304], end guards are not employed. The effect of heat losses from the ends of the specimen is minimized by using a long specimen and monitoring the electric power within only a small section of the specimen away from the ends.

The guarded cylindrical method employing end guards at both ends of the specimen to prevent axial heat losses was developed by Powell [305] and first reported in 1939 for measurements on Armco iron at high temperatures. In the guarded cylindrical method the specimen is generally composed of stacked disks with a coaxial central hole containing either a heater or a heat sink. Temperatures within the specimen are measured either by thermocouples or by an optical pyrometer. For details of some of the useful apparatus employing the guarded cylindrical method, the reader may consult references [295, 305–310].

The thermal conductivity is calculated from the expression

$$k = \frac{q \ln(r_2/r_1)}{2\pi l(T_1 - T_2)} \tag{34}$$

where l is the length of the central heater and T_1 and T_2 are temperatures measured at radii r_1 and r_2, respectively.

Hoch *et al.* [311] have developed a quasi-radial heat flow method in which the specimen in the form of a disk or short cylinder is heated at its convex cylindrical surface in high vacuum by means of high frequency induction and is losing heat from its flat circular end faces by radiation. In this method the inward flow of heat from the cylindrical surface, at which the generation of heat is localized, into the interior of the specimen is, of course, not strictly radial, and the temperature gradient of the flat circular end faces along the radius is related to the thermal conductivity. The theory of this method has recently been revised by J. Vardi and R. Lemlich (to be published in the *Journal of Applied Physics* in 1970).

(ii) *Spherical and Ellipsoidal Methods.* In a spherical method, the heater is completely enclosed inside the specimen which is in the form of a hollow sphere. The heat supplied by the internal heater passes through the specimen radially without loss. Theoretically, this method is ideal. However, there are a number of practical difficulties such as difficult fabrication of a spherical heater which produces uniform heat flux in all radial directions, difficult fabrication of spherical specimens, difficult positioning of thermocouples along spherical isotherms, etc., which have prevented this method from being popular. Laws, Bishop, and McJunkin [312] seem the first to have used this method on solids (not loose-filled materials). A detailed description of a modern design may be found in [301]. The thermal conductivity is calculated from the expression

$$k = \frac{q(1/r_1 - 1/r_2)}{4\pi(T_1 - T_2)} \tag{35}$$

The ellipsoidal method is similar to, but has some advantages over, the spherical method. It was developed by a group of researchers at MIT [313–315]. The major advantage of using a specimen in the form of an ellipsoid instead of a sphere is that the isothermal surfaces near the plane of the minor axes of an ellipsoid are rather flat so that straight thermocouple wires can be used without ill effect. If a is half the focal length of the ellipsoid and T_1 and T_2 are temperatures measured at respectively two radii r_1 and r_2 on the minor axis, the thermal conductivity is determined by the expression

$$k = \frac{q}{8\pi a(T_1 - T_2)} \times \ln\left(\frac{\sqrt{(a^2 + r_2^2)} - a}{\sqrt{(a^2 + r_2^2)} + a} \cdot \frac{\sqrt{(a^2 + r_1^2)} + a}{\sqrt{(a^2 + r_1^2)} - a}\right) \tag{36}$$

Despite the aforementioned advantage, the ellipsoidal method is also rarely used due to the other experimental difficulties common to both the ellipsoidal and spherical methods.

(iii) *Concentric Sphere and Concentric Cylinder Methods.* Concentric sphere and concentric cylinder methods are used mainly for measurements on powders, fibers, and other loose-filled materials. The specimen is filled in the space between two concentric spherical (or cylindrical) shells, with the inner sphere (or cylinder) being a heater or a heat sink. In a concentric cylinder apparatus, end guards are usually used to prevent axial heat flow.

A concentric sphere method was first used by Péclet [316] and reported in 1860 with the inner sphere filled with hot water as heater. However, a steady-state condition was not achieved in his pioneering measurements. Later Nusselt [317] succeeded in using this method for measurements on insulating materials with an electric heater installed inside the inner spherical shell. A modern apparatus using a boil-off calorimeter in the inner sphere was described in [318].

A concentric cylinder method was used by Stefan [319] and reported in 1872 for the measurements on gases. It was later adopted for measuring loose-filled materials. Reference [320] describes a modern apparatus employing a guarded boil-off calorimeter inside the inner cylinder. Recently, Flynn and Watson [321] used a concentric cylinder method to measure the high-temperature thermal conductivity of soil.

(iv) *de Sénarmont's Plate Method.* de Sénarmont [322–326] in 1847–48 used a radial heat flow plate method to determine the anisotropy in thermal conductivity of crystalline substances. However, this method does not yield absolute values of thermal conductivity, and furthermore, the axial heat loss is not prevented.

In his method, a thin plate of the sample was coated with a thin film of white wax; heat was applied at a central point by means of a hot, thin silver tube tightly fitted in a hole at the center of the plate. The wax melted around the region where heat was supplied and the bounding line of the melted wax was the visible isotherm, the shape of which indicated the variation of thermal conductivity in the different directions.

If the substance is isotropic, the bounding curve of the melted wax is a circle, whereas for anisotropic substances, this curve is elliptical. In such a case, the ratio of the two thermal conductivities k_a and k_b along the two axes a and b of the ellipse is given by the expression

$$\frac{k_a}{k_b} = \left(\frac{a}{b}\right)^2 \tag{37}$$

Powell [327] has modified the method in his simple test for anisotropic materials. In testing gallium, he cooled a slice of crystal locally by means of a piece of solid carbon dioxide and observed the contours of the dew and frost areas which formed around the cooled zone. For testing graphite, he followed de Sénarmont's original method but the surface of the plate used was covered with frost by precooling instead of being coated with wax.

b. Comparative Methods

(i) *Concentric Cylinder Method.* This method has been used for measurements on some special materials such as those that are radioactive or reactive [328–330] and not for ordinary materials, because it does not have any major advantage over the absolute method. A typical apparatus of this kind consists of a cylindrical specimen which is surrounded by a concentric cylindrical reference sample of known thermal conductivity. A coaxial central hole in the specimen contains a heat source, which produces heat flowing radially through both the specimen and the reference sample. The advantage of using this meth for measuring radioactive or reactive mater..'s is that the reference sample which encloses the specimen serves also as a means of containment. The thermal conductivity is determined from the expression

$$k = k_r \frac{(T_3 - T_4)\ln(r_2/r_1)}{(T_1 - T_2)\ln(r_4/r_3)} \tag{38}$$

where T_1 and T_2 are two temperatures measured in the specimen at two radii r_1 and r_2, respectively, and T_3 and T_4 in the reference sample, at r_3 and r_4, respectively.

(ii) *Disk Method.* Robinson [331] developed a method, which he termed the "conductive-disk method," for comparative measurements on insulators. This method employs inward radial heat flow from a heater at the circular edge of a disk of suitable conductive reference material sandwiched between two like specimens, which are in turn sandwiched between two circular cold plates at a constant lower temperature. However, the heat flow in this case is not strictly radial, since, as the heat flows radially in the conductive disk toward the center, it flows also from the disk through the specimens to the cold plates. As a result, the steady-state temperature of the disk decreases toward its center, and the rate of decrease depends on the thermal conductivity of the specimens. Robinson obtained an expression for calculating the thermal conductivity of the specimens from the known thermal conductivity and thickness of the disk and from the temperatures of the cold plates and of the disk at its center and at a suitable radius.

D. Direct Electrical Heating Methods

In direct electrical heating methods, the specimen is heated directly by passing an electric current through it. These methods are therefore limited to measurements on reasonably good electrical conductors. Furthermore, they usually yield thermal conductivity in terms of electrical conductivity rather than directly. However, direct electrical heating methods have also certain advantages over other methods. They offer a means of easily attaining very high temperatures, use simpler apparatus and experimental techniques than other methods at high temperatures, use relatively small specimens, require relatively short time to reach equilibrium, and also offer the possibility of concurrent determinations of a number of physical properties on the same specimen. According to specimen geometry, these methods fall into two major categories: cylindrical rod and rectangular bar. They will be briefly discussed below. Comprehensive reviews [332–334] on direct electrical heating methods are available.

The thermoelectrical method to be discussed later involves also the direct passage of an electric current through the specimen. However, in that method the specimen is heated (and cooled) by the Peltier effect which is totally different from the Joulean heating responsible for maintaining the specimen temperature in the direct electrical heating methods discussed here. It is therefore preferable to discuss the thermoelectrical method separately in another section.

a. Cylindrical Rod Methods

The direct electrical heating methods in this category involve heating specimens in the form of rods, thin wires, or tubes by the passage of regulated electric current, and measuring potential drops and temperatures for the calculation of thermal conductivity.

There are many different techniques and variants that have been employed over the years since Kohlrausch [335–338] first developed this method. The different variants may be divided into three categories as discussed below.

(i) *Longitudinal Heat Flow Method.* In this method the rod is well insulated or guarded to prevent radial heat losses so that the Joule heat generated in the specimen flows to the two ends. This is the method originally developed by Kohlrausch [335–338]. If the two ends of the rod are held at the same temperature and assuming that in a small temperature range the thermal and electrical conductivities are independent of temperature, the thermal conductivity is given by the simple relation

$$k = \frac{1}{8\rho}\frac{(V_1 - V_3)^2}{(T_2 - T_1)} \tag{39}$$

where ρ is the electrical resistivity, V_1 and V_3 are the electrical potentials at locations 1 and 3 on the specimen which are at equal and opposite distances from the midpoint 2, and T_1 and T_2 are temperatures at locations 1 and 2. This method was first used for actual measurements by Jaeger and Diesselhorst [339]. A variant of it has been used by Mikryukov [332]. The so-called "necked-down-sample method" [340] may also be considered as a longitudinal heat flow method.

(ii) *Radial Heat Flow Method.* This method uses a thick rod or tube and allows radial heat transfer. Under steady-state conditions, the Joule heat generated in the specimen at regions remote from the ends flows radially to the surface and is then transferred by convection and radiation to the surroundings. This method was first suggested by Mendenhall and applied by Angell [341]. In the case of a cylindrical rod specimen and assuming that in a small temperature range the thermal and electrical conductivities are independent of temperature, the thermal conductivity is given by the simple relation

$$k = \frac{EI}{4\pi l(T_1 - T_2)} \tag{40}$$

where I is the electric current, E is the electrical potential drop over a length l at the central region of the specimen, and T_1 and T_2 are the temperatures at the axis and surface, respectively, of the rod at the central region. These temperatures were too small for precise measurements on metals, but Powell and Schofield [342] used it for poorer conducting carbon and graphite, and they also took account of the variation of thermal and electrical conductivities with temperature.

(iii) *Thin-Rod-Approximation Method.* The general form of the present method uses a long thin filament heated electrically in vacuum and allows both longitudinal heat conduction and lateral heat transfer by radiation. The "thin-rod approximation" involves the assumption that the temperatures and potentials in all planes normal to the specimen axis are uniform, i.e., their differences in the radial direction are negligible. Worthing [343] first employed this method for measurements on U-shaped filaments at incandescent temperatures. There are many variants [344–358] of this method, all with more or less different experimental designs, mathematical assumptions, and/or computational techniques.

Taylor, Powell, and co-workers [354, 356–358] at TPRC have made improvements and advancements on this method. They have taken the Thomson effect into account, which had never been done before, and have included the temperature dependence of various physical properties. They used the general equation directly and their advanced computational techniques have eliminated the need for mathematical approximations and for matching certain experimental conditions.

It seems appropriate to mention the considerable discrepancies which have resulted from the data obtained by various workers, all of whom used different variants of the direct electrical heating method. One of the most recent of the TPRC papers [358] contains an interesting graphical presentation of all the determinations made on tungsten by these methods for the temperature range 1600 to 2800 K. Six of the fourteen groups of workers obtained results lying well above the recommended curve of Powell, Ho, and Liley [359], and one was well below it, the spread being of the order of 50 percent, 80 percent, and 70 percent at 1800, 2200 and 2600 K, respectively. The other seven had results within about 10 percent of the recommended curve, while the curve fitting the new results of [358] was some 3 to 5 percent below the recommended curve. Earlier reports [333, 356] had contained examples of similar discrepancies for other high-melting-point metals, such as molybdenum, stainless steel, and platinum. The main reasons for these differences include failure to measure accurately small temperature gradients at high temperature, failure to match boundary conditions, errors resulting from simplifying mathematical approximations, and the use of temperature regions in which the thermal conduction term is small compared with the Joulean heating and radiation loss terms.

These have been quoted as examples of current experimental work at the TPRC, which became necessary because of the need to resolve some seriously discordant data and to gain further insight into their causes. The impression must not be given, however, that such discrepancies are confined to metals or to direct electrical heating methods. This is by no means the case, and the literature of heat conduction contains many examples of discordant results for all types of methods used. Titanium carbide, one of the materials dealt with in Volume 2, may be mentioned. The first determinations reported on titanium carbide by Vasilos and Kingery [360] to high temperatures showed the thermal conductivity to decrease from about 0.2 W cm^{-1} C^{-1} at 200 C to 0.1 W cm^{-1} C^{-1} at 500 C and 0.04 W cm^{-1} C^{-1} at 1000 C. Two methods had been used: the divided-rod comparative method for a cube sample up to about 800 C and an ellipsoidal radial-flow method from about 500 to 1100 C. The former method gave results which were greater by from 30 percent to 20 percent over their common temperature range. In 1961 Taylor [361] used a better-substantiated radial heat flow method for cylindrical samples of titanium carbide, and found the thermal conductivity to increase linearly from 0.38 W cm^{-1} C^{-1} at 600 C to 0.47 W cm^{-1} C^{-1} at 1600 C.

These two sets of values, differing at about 1000 C by about one order of magnitude and having temperature coefficients of opposite sign, naturally aroused interest, and subsequent contributions by Laubitz [362], Hoch and Vardi [363], and Powell [364, 365] and the nonsteady-state measurements of Taylor and Morreale [366] all supported the higher values of Taylor [361]. It would seem that the higher thermal conductivity of titanium carbide led to serious errors being associated with the method of Vasilos and Kingery, which were not apparent for substances of lower thermal conductivity. Incidently, had the much simpler measurement of electrical resistivity been also made, the unusually low resultant Lorenz function should have provided warning that abnormal data were being obtained. It might well be added that the inclusion of electrical resistivity measurements on all possible occasions is a simple extra measurement which also serves to provide very useful information about the properties of the material under test and its behavior on temperature cycling.

The foregoing example also indicates that users of the data tables of these volumes should, in the absence of any analysis that has produced a curve of recommended values, tend to be critical of the values presented, until these are seen to be well supported by independent experiments, correlations, or by additional checks such as that of a reasonable Lorenz function.

An additional outcome of the current TPRC investigation has been the development of a method and of equipment capable of determining a large number of high-temperature physical properties [367]. Their multiple-purpose apparatus is the first operational model that can accurately measure the thermal conductivity, electrical resistivity, total and spectral hemispherical emittance, Thomson coefficient, and Lorenz function on one and the same specimen. This apparatus can also measure the specific heat, enthalpy, thermal diffusivity, thermal expansion, Seebeck coefficient, Peltier coefficient, and Richardson coefficient. The merit of obtaining many different physical properties from one and the same specimen so as to permit meaningful quantitative cross-correlations between properties need not be emphasized here.

b. Rectangular Bar Method

This method was developed by Longmire [368] and is a geometrically-deformed variant of the radial heat flow method. The specimen used is in the form of a long rectangular bar. This special specimen geometry enables all temperature measurements to be made on the surface of the specimen. As the specimen is heated electrically in vacuum, the heat loss by radiation establishes a radial temperature gradient, and the temperature at the center line of the wider surface of the rectangular bar will be higher than that at the center line of the narrower surface. From measurements of these two temperatures and the electrical conductivity and total hemispherical emittance of the bar, the thermal conductivity can be calculated using the equation derived by Longmire.

Longmire's method was improved by Pike and Doar [369–371] both in mathematical analysis and in experimental techniques. They further extended this method to the determination of anisotropy in thermal conductivity.

E. Thermoelectrical Method

The thermoelectrical method was developed by Borelius [372] and reported in 1917 for the combined measurement of the Peltier heat and thermal conductivity of the same material, and is particularly applicable to the measurements on thermoelectric materials.

In this method, the specimen is held between metallic contacts through which a small direct electric current is passed. Peltier heating thus occurs at one end of the specimen and Peltier cooling at the other end, which establishes a temperature gradient along the specimen. Under steady-state conditions, the rate of Peltier heat generation at the hot end is just balanced by the rate of heat conduction from the hot to the cold end. Thus the thermal conductivity can be calculated from the rate of Peltier heat production πI (π being the Peltier coefficient), the temperature difference between the ends ΔT, the cross-sectional area A, and the length l by the expression

$$k = \frac{\pi I l}{A \Delta T} \tag{41}$$

Since $\pi = ST$, S being the Seebeck coefficient, π can be determined by measuring the Seebeck coefficient from the potential difference between the ends after the temperature difference ΔT is established.

When the direct electric current is passed through the specimen, Joulean heating will occur, of course. However, the Joulean heating effect can be made negligibly small in a good thermoelectric material by choosing the current small enough, because the Joule heat production is proportional to I^2 while the Peltier heat production is proportional to I. The Thomson heat effect is generally small.

Borelius' method was used by Sedström [373, 374] for measurements on alloys. Some forty years later, Putley [375] and Harman [376, 377] reinvented this method. A recent apparatus is described in [378].

A transient thermoelectrical method was developed by Hérinckx and Monfils [379]. In this method a direct electric current is passed through the specimen and the time dependence of the resulting potential drop across the specimen is observed. The thermal conductivity can be derived from the shape and asymptote of this potential drop versus time curve provided that the Seebeck coefficient is known.

F. Thermal Comparator Method

The thermal comparator method was developed by Powell [380–383] and is a simple comparative method for the rapid, easy measurement of thermal conductivity.

The essential part of the thermal comparator is an insulated probe with a projecting tip. The probe is integral with a thermal reservoir held at a temperature about 15 to 20 degrees above room temperature. A surface thermocouple is mounted at the tip of the probe and is differentially connected to the thermal reservoir for the measurement of the temperature difference between the reservoir and the tip.

In operation, the probe is gently placed on the surface of the test material. Upon contact of the probe tip of known thermal conductivity k_1 and originally at temperature T_1 with the surface of the test material of thermal conductivity k_2 and at room temperature T_2, the temperature of the probe tip drops quickly to an intermediate temperature, T, given by the expression

$$T_1 - T = (T_1 - T_2)\left(\frac{k_2}{k_1 + k_2}\right) \tag{42}$$

This temperature difference is registered by the emf reading of the differential thermocouple after a brief transient period (1 to 2 seconds) has elapsed.

From the emf readings of tests on a series of reference samples of known thermal conductivity, a calibration curve is obtained, and the thermal conductivity of an unknown specimen can thus be determined from the emf reading through the calibration curve.

Powell [384] has made a comprehensive review on this method. Some subsequent developments are discussed in [385]. The *thermal comparator* has been developed by TPRC as an instrument [385] for the rapid determination of the thermal conductivity of solids and liquids and is commercially available from The McClure Park Corp., West Lafayette, Indiana.

3. NONSTEADY-STATE METHODS

In nonsteady-state methods, the temperature distribution in the specimen varies with time. The rate of temperature change at certain positions along the specimen is measured in the experiment, and no measurement of the rate of heat flow is required. These methods normally determine the thermal diffusivity, from which the thermal conductivity can be calculated with an additional knowledge of the density and specific heat of the test material. Nonsteady-state methods fall into two major categories, the periodic and the transient heat flow methods, as briefly discussed below. These methods have been comprehensively reviewed by Danielson and Sidles [386], and will be dealt with in Volume 10 of the TPRC Data Series.

A. Periodic Heat Flow Methods

In periodic heat flow methods, the heat supplied to the specimen is modulated to have a fixed period. The resulting temperature wave which propagates through the specimen with the same period is attenuated as it moves along. Consequently, the thermal diffusivity can be determined from measurements of the amplitude decrement and/or phase difference of the temperature waves between certain positions in the specimen. In most of the periodic heat flow methods, heat flow is in the longitudinal (axial) direction. However, methods with heat flow in the radial direction have also been used.

a. Longitudinal Heat Flow Method

The periodic heat flow method was first developed by Ångström [207, 387] and reported in 1861. In his method a variable heat source capable of producing a sinusoidal temperature variation was attached to the center of a long thin rod specimen, and the temperatures as a function of time at two positions l apart towards the ends of the rod were measured. From these temperature-time measurements, the velocity, v, and the amplitude decrement δ of the temperature wave can be determined for the calculation of thermal diffusivity. This method has been modified and improved by King [388] and others [389–391]. The thermal diffusivity may be calculated from the expression [390]

$$D = \frac{vl}{2 \ln \delta} \tag{43}$$

The Ångström method, which uses a long rod, has its limitations. In some cases, specimens in the form of long rods may not be available, and in other cases, such as in the measurements on poor conductors at high temperatures, heat guarding to prevent lateral heat losses from a long rod may be difficult. Consequently, methods using specimens in the form of a small plate or disk have been developed [392–394].

b. Radial Heat Flow Method

In this method, the specimen in the form of a cylinder is heated by a heat source capable of producing a periodical temperature variation either at the axis or at the circumference, and the radial temperature variations with time are measured. The thermal diffusivity may be calculated from the phase change of the temperature oscillations, or from the amplitude variation of the oscillations with frequency.

Tanasawa [395] used this method in 1935 for the measurements on humid materials. In his method, a sinusoidal temperature was produced on the surface of a cylindrical specimen, and the temperatures at different radial distances were measured for the calculation of thermal diffusivity.

Filippov and his co-workers have further developed a method of this type [396] and used it for the measurements on metals [397] and molten metals [398, 399] at high temperatures.

The nonsteady-state radial heat flow method has also been employed for measurements on insulators [400, 401].

B. Transient Heat Flow Methods

Transient heat flow methods, both longitudinal and radial, were first used by Neumann [402, 403] and reported in 1862. In his method, one end of a bar was heated by a flame until the temperature attained the equilibrium state. The flame was then suddenly removed and temperatures at two positions along the bar were measured as a function of time. Thermal diffusivity can then be calculated from these measurements. For the measurements on poor conductors, he used another method in which a cube or sphere was heated uniformly to a high temperature and then was allowed to cool in the air. The temperatures at the surface and at the center were measured as a function of time.

The modern transient heat flow methods have a wide variety. In the following a number of the major variants are briefly discussed.

a. Longitudinal Heat Flow Method

Similar to the longitudinal periodic heat flow method, the longitudinal transient heat flow method can also be subdivided into two major categories, those using a long rod and those using a small plate (or disk).

Methods in which one end of a long rod, which is initially at uniform temperature, is subjected to a short heating pulse have been developed [404, 405]. There are also methods in which steady heating is provided at one end of a rod and the temperatures as a function of time at two or more positions along the rod are observed [406–408].

Transient heat flow methods in which the specimen used is in the form of a small plate or disk have been developed by a number of workers [409–412].

b. Flash Method

Although the flash method is a variant of the longitudinal transient heat flow method using a small thin disk specimen geometry, it has a very special feature which makes it a class of its own. In the "flash" method, a flash of thermal energy is supplied to one of the surfaces of a disk specimen within a time interval that is short compared with the time required for the resulting transient flow of heat to propagate through the specimen. This method was developed by Parker, Jenkins, Butler, and Abbott [413] and reported in 1961.

In use, a heat source such as flash tube or laser supplies a flash of energy to the front face of a thin disk specimen, and the temperature as a function of time at the rear face is automatically recorded. The thermal diffusivity is given from the thickness of the specimen, l, and a specific time, $t_{1/2}$, at which the back-face temperature reaches half its maximum value by the expression

$$D = 1.37\, l^2/\pi^2 t_{1/2} \qquad (44)$$

Other expressions for the calculation of thermal diffusivity have also been used.

Subsequent improvements on this method have been made [414, 415] by the application of corrections for the finite pulse-time effect and the radiation-loss effect.

c. Radial Heat Flow Method

As mentioned before, a radial heat flow method was used by Neumann [402, 403] for measurements on poor conductors. His specimens were of spherical shape.

In modern apparatus, specimens in the form of cylinders are used. A long cylindrical specimen, hollow or solid, which is initially at uniform temperature, is heated either at the axis or at the outer surface and the temperatures as a function of time at different radial distances are measured. In the methods developed by Ginnings [416] and by Cape, Lehman, and Nakata [417], cylindrical specimens were continuously heated at the outer surface.

Specimens in the form of hollow disks stacked on an axial heater with outer disks as end guards have been used by Carter, Maycock, Klein, and Danielson [418].

Although the line heat source and probe methods are also radial transient heat flow methods, they are quite different from other methods and will be discussed in a separate section below.

d. Line Heat Source and Probe Methods

The line heat source method was originally developed by Stalhane and Pyk [419] in 1931 and used for measurements on ceramic materials [420]. This method is suitable for the measurements on loose-filled materials such as powders.

In this method, a long thin heater wire which serves as a line heat source was embedded in a large specimen initially at uniform temperature. The heater is then turned on, which produces constant heat, q, per unit length and time, and the temperature at a point in the specimen is recorded as a function of time. The thermal conductivity is given by the expression

$$k = \frac{q}{4\pi(T_2 - T_1)} \ln \frac{t_2}{t_1} \qquad (45)$$

where $(T_2 - T_1)$ is the temperature difference at two times t_1 and t_2. Subsequently, this method was also developed by van der Held and his co-workers [421, 422], and others.

The probe method is a more practical line heat source method in which the heat source is enclosed inside a probe for protection and for easy insertion into a specimen. This method was developed by Hooper and his co-workers [423, 424], and others. Blackwell [425, 426] has derived theoretical treatments for practical departures from a true line source, and in the discussion of a paper [427] dealing with the use of a probe method in connection with the routing of electric power cables, he advocated the use of very small thermistors as an alternative to thermocouples.

e. Moving Heat Source Method

The moving heat source method was developed by Rosenthal and his co-workers [428–430], and involves the establishment of a quasi-steady-state temperature distribution in a long tubular-shaped specimen heated by a moving localized heat source of constant intensity. As the heat source approaches and moves away, each point in the specimen is subjected to a temperature rise and fall. When the heat source passes over the specimen, the temperature at a point remote from the ends is recorded as a function of time. From this record, a curve of the logarithm of the temperature variation with time is made. The thermal diffusivity is given from the velocity of the heat source, v, and the slopes P_r and P_f on the rising and falling portions of the curve at the same temperature by the expression

$$D = \frac{v^2}{P_r + P_f} \tag{46}$$

f. Comparative Method

A comparative method employing transient heat flow was developed by Hsu [431, 432]. In this method, two identical sets of composite blocks are used. Each set consists of a test specimen and a reference sample whose properties are known. Initially, the two sets are heated separately to uniform but different temperatures, and then they are suddenly brought into contact, with the two test specimens touching each other. The transient temperature at the contact plane between the test specimen and reference sample corresponding to a certain time is measured, and from this the thermal diffusivity of the specimen can be calculated.

Another transient-heat-flow comparative method has been used by Deem *et al.* [433] for the measurements on irradiated materials. The method of measurement is to place the lower ends of a specimen and a reference sample, which are of the same size and initially at room temperature, in molten tin maintained at a constant elevated temperature and then measure the times required for the upper ends to reach a predetermined intermediate temperature. The ratio of the thermal diffusivities is assumed directly proportional to the ratio of the two times measured for the specimen and the reference material.

Data Presentation and Related General Information

1. SCOPE OF COVERAGE

Presented in this volume are the thermal conductivity data for 69 elements, 172 nonferrous binary alloy systems, 80 nonferrous multiple alloy systems, 25 ferrous alloy systems, 60 intermetallic compounds, 16 mixtures of intermetallic compounds, and 13 miscellaneous alloys and mixtures. These data were obtained by processing over 2150 research documents on the thermal conductivity of metallic materials dated from around 1800 to 1967, of which 1000 contain usable data. Materials within each group are arranged in alphabetical order by name, as listed in the *Grouping of Materials and List of Figures and Tables* in the front of the volume. In all, this volume reports 5539 sets of data on 892 materials, which are listed in the *Material Index* at the end of the volume. The *Material Index* lists also the materials contained in the companion volumes (Volumes 2 and 3) on thermal conductivity.

In addition to metals, semimetals and semiconductors are included in this volume. Although a nonmetal, boron is also included because of its extensive use as an alloying element for metallic alloys. Of course, it is also contained in Volume 2, which covers nonmetals.

The temperature ranges covered by the thermal conductivity data for many materials are from near absolute zero to past the melting point, though for most high-temperature alloys the available data are limited to the solid range.

The data for the elements and a small number of alloys have been critically evaluated, analyzed, and synthesized, and recommended reference values are presented. This procedure involves critical evaluation of the validity of available data and related information, resolution and reconciliation of disagreements of conflicting data, correlation of data in terms of various affecting parameters, and comparison of the resulting values with theoretical predictions or with results derived from semi-theoretical relationships or from generalized empirical correlations. Besides critical evaluation and analysis of the existing data, thermodynamic principles and semi-empirical techniques are employed to fill in gaps and to extrapolate existing data so that the resulting recommended values are internally consistent and cover as wide a range of the controlling parameters as possible. Future editions of this volume will contain recommended values for an increasing number of materials.

2. PRESENTATION OF DATA

The thermal conductivity data and information on test specimens for each material are generally presented in three sections arranged in the following order: Original Data Plot, Specification Table, and Data Table. For the elements and a small number of alloys, a Graph and Table of Recommended Values is added as a fourth section. Furthermore, for a number of materials for which there exists only a small number of data, the Original Data Plot may be omitted.

The Original Data Plot is a full-page log-log-scale graphical presentation of the original thermal conductivity data as a function of temperature. When several sets of data are coincident, some of the data sets may be omitted from the plot for the sake of clarity. They are, however, reported in the Data Table and Specification Table.

The Specification Table provides in a concise form the comprehensive information on the test specimens for which the data are reported. The curve numbers in the Specification Table correspond exactly to the numbers which also appear in the Original Data Plot and in the Data Table. The Specification Table gives for each set of data the reference number which corresponds to the number in the list of References to Data Sources, the year of publication of the original data, the method of measurement, the temperature range, the reported estimate of error of the data, the specimen designation, and the specimen characterization and test conditions. The information of the last category, which is reported to the extent provided in the original source document, includes the following:

(1) Purity, chemical composition, carrier concentration;
(2) Type of crystal, crystal axis orientation, type and concentration of crystal defects;
(3) Microstructure, grain size, inhomogeneity, and additional phases;
(4) Specimen shape and dimensions, method and procedure of fabrication;
(5) Thermal history and cold work history, heat treatment, mechanical, irradiative, and other treatments;
(6) Manufacturer and supplier, stock number, and catalog number;
(7) Test environment, degree of vacuum or pressure, heat flow direction, strength and orientation of the applied magnetic field;
(8) Pertinent physical properties such as density, porosity, hardness, electrical resistivity (residual, ratio, and temperature variations), Lorenz function, transition temperatures, etc.;
(9) Reference material and its property values for a comparative method of measurement;
(10) Form in which the extracted data are presented in the original source document other than raw data points;
(11) Additional information obtained directly from the author.

Unfortunately, in the majority of cases the authors do not report in their research papers all the necessary pertinent information to fully characterize and identify the materials for which their data are reported. This is particularly true for the authors of earlier investigations. Consequently, the amount of information on specimen characterization reported in the Specification Tables varies greatly from specimen to specimen.

In the Data Table, tabular presentation is given for all the data described in the Specification Table and shown or not shown in the Original Data Plot. Many tabular data which are not presented in the original source documents have been obtained directly from the authors through private communications. Attempts have often been made to contact the authors for tabular data whenever the original data are given in the research paper only in a figure too small to warrant accurate data extraction compatible with the reported accuracy of the measurement. The thermal conductivity data are given in watts per centimeter per degree Kelvin, and the temperatures in degrees Kelvin. For data conversion, the reader is referred to the Conversion Factors for Thermal Conductivity Units given later.

The recommended thermal conductivity values for a material are reported in a separate graph and table following the Data Table. The estimated accuracy of the recommended values and special remarks on material characterization and identification are also noted in the table.

3. CLASSIFICATION OF MATERIALS

The classification scheme as shown in the table for the elements and alloys contained in this volume is based strictly upon the chemical composition of the material. This scheme is mainly for the convenience of materials grouping and data organization, and is not intended to be used as basic definitions for the various material groups.

4. SYMBOLS AND ABBREVIATIONS USED IN THE FIGURES AND TABLES

In the Specification Tables, the code designations used for the experimental methods are as follows:

C	Comparative method
E	Direct electrical heating method
F	Forbes' bar method
L	Longitudinal heat flow method
P	Periodic or transient heat flow method
R	Radial heat flow method
T	Thermoelectrical method

Other symbols and abbreviations used in the figures and/or tables are as follows:

b.c.c.	Body-centered cubic
c.	Cubic
c.p.h.	Close-packed hexagonal
d	Density
d.	Diamond (crystal structure)
Decomp.	Decomposition
f.c.c.	Face-centered cubic
f.c.t.	Face-centered tetragonal
h.	Hexagonal

Classification of Materials

Classification			Limits of composition (weight percent)*			
			X_1	$X_1 + X_2$	X_3	X_4
1. Metallic elements			>99.5	—	<0.2	<0.2
2. Nonferrous alloys ($X_1 \neq$ Fe)	A. Binary alloys		—	≥99.5	≥0.2	≤0.2
	B. Multiple alloys		—	≥99.5	>0.2	>0.2
			—	<99.5	≥0.2	≤0.2
			—	<99.5	>0.2	>0.2
			≤99.5	—	<0.2	<0.2
			X_1	X_2	X_3	Mn, P, S, or Si
3. Ferrous alloys (X_1 = Fe)	A. Carbon steels	Group I	Fe	C ≤ 2.0	≤ 0.2	≤ 0.6
		Group II	Fe	C ≤ 2.0	≤ 0.2	> 0.6
			Fe	C ≤ 2.0	> 0.2	≤ 0.6
			Fe	C ≤ 2.0	> 0.2	> 0.6
	B. Cast irons	Group I	Fe	C > 2.0	≤ 0.2	≤ 0.6
		Group II	Fe	C > 2.0	≤ 0.2	> 0.6
			Fe	C > 2.0	> 0.2	≤ 0.6
			Fe	C > 2.0	> 0.2	> 0.6
	C. Alloy steels†	Group I	Fe	≠ C	≤ 0.2 and C ≤ 2.0	≤ 0.6
		Group II	Fe	≠ C	≤ 0.2	> 0.6
			Fe	≠ C	> 0.2	≤ 0.6
			Fe	≠ C	> 0.2	> 0.6

*$X_1 \geq X_2 \geq X_3 \geq X_4$ . . . .
†In case Mn, P, S, or Si represents X_2, this particular element is dropped from the last column. Alloy cast irons are also included in Group II of this category.

I.D.	Inside diameter
k	Thermal conductivity
M.P.	Melting point
monocl.	Monoclinic
NTP	Normal temperature and pressure
O.D.	Outside diameter
orthorh.	Orthorhombic
r.	Rhombohedral
s.c.	Superconducting
Subl.	Sublimation
T	Temperature
t.	Tetragonal
Temp.	Temperature
T.P.	Transition point
Vit.	Vitreous
ρ	Electrical resistivity
μ	Micro
>	Greater than
<	Less than
~	Approximately
③	Curve number
[4]	Single data point number

5. CONVENTION FOR BIBLIOGRAPHIC CITATION

For the following types of documents the bibliographic information is cited in the sequences given below.

Journal Article:

a. Author(s)—The names and initials of all authors are given. The last name is written first, followed by initials.
b. Title of article—In this volume, the titles of the journal articles listed in the *References to Text* are given, but not of those listed in the *References to Data Sources.*
c. Journal title—The abbreviated title of the journal as used in *Chemical Abstracts* is given.

d. Series, volume, and number—If the series is designated by a letter, no comma is used between the letter for series and the numeral for volume, and they are underlined together. In case series is also designated by a numeral, a comma is used between the numeral for series and the numeral for volume, and only the numeral representing volume is underlined. No comma is used between the numerals representing volume and number. The numeral for number is enclosed in parentheses.
e. Pages—The inclusive page numbers of the article.
f. Year—The year of publication.

Report:

a. Author(s).
b. Title of report—In this volume, the titles of the reports listed in the *References to Text* are given, but not of those listed in the *References to Data Sources*.
c. Name of the responsible organization.
d. Report, or bulletin, circular, technical note, etc.
e. Number
f. Part
g. Pages
h. Year
i. ASTIA's AD number—This is given in square brackets whenever available.

Book:

a. Au...or(s)
b. Title
c. Volume
d. Edition
e. Publisher
f. Place of publication
g. Pages
h. Year

6. CONVERSION FACTORS FOR THERMAL CONDUCTIVITY UNITS

The conversion factors given in the table on page 42a are based upon the following basic definitions:

1 in.	= 0.0254 (exactly) m*
1 lb	= 0.45359237 kg*
1 cal_{th}	= 4.184 (exactly) J*
1 cal_{IT}	= 4.1868 (exactly) J*
1 $Btu_{th}\ lb^{-1}\ F^{-1}$	= 1 $cal_{th}\ g^{-1}\ C^{-1}$†
1 $Btu_{IT}\ lb^{-1}\ F^{-1}$	= 1 $cal_{IT}\ g^{-1}\ C^{-1}$†

The subscripts "th" and "IT" designate "thermochemical" and "International Steam Tabie," respectively.

7. CRYSTAL STRUCTURES, TRANSITION TEMPERATURES, AND OTHER PERTINENT PHYSICAL CONSTANTS OF THE ELEMENTS

The table on the following pages contains information on the crystal structures, transition temperatures, and certain other pertinent physical constants of the elements. This information is very useful in data analysis and synthesis. For example, the thermal conductivity of a material generally changes abruptly when the material undergoes any transformation. One must therefore be extremely cautious in attempting to extrapolate the thermal conductivity values across any phase, state, magnetic, or superconducting transition temperature, as given in the table.

No attempt has been made to critically evaluate the temperatures/constants given in the table and they should not be considered recommended values. This table has an independent series of numbered references which immediately follows the table.

*National Bureau of Standards, "New Values for the Physical Constants Recommended by NAS-NRC," *NBS Tech. News Bull.*, 47 (10), 175-7, 1963.

FIGURE SHOWS ONLY 45 OF THE CURVES REPORTED IN TABLE

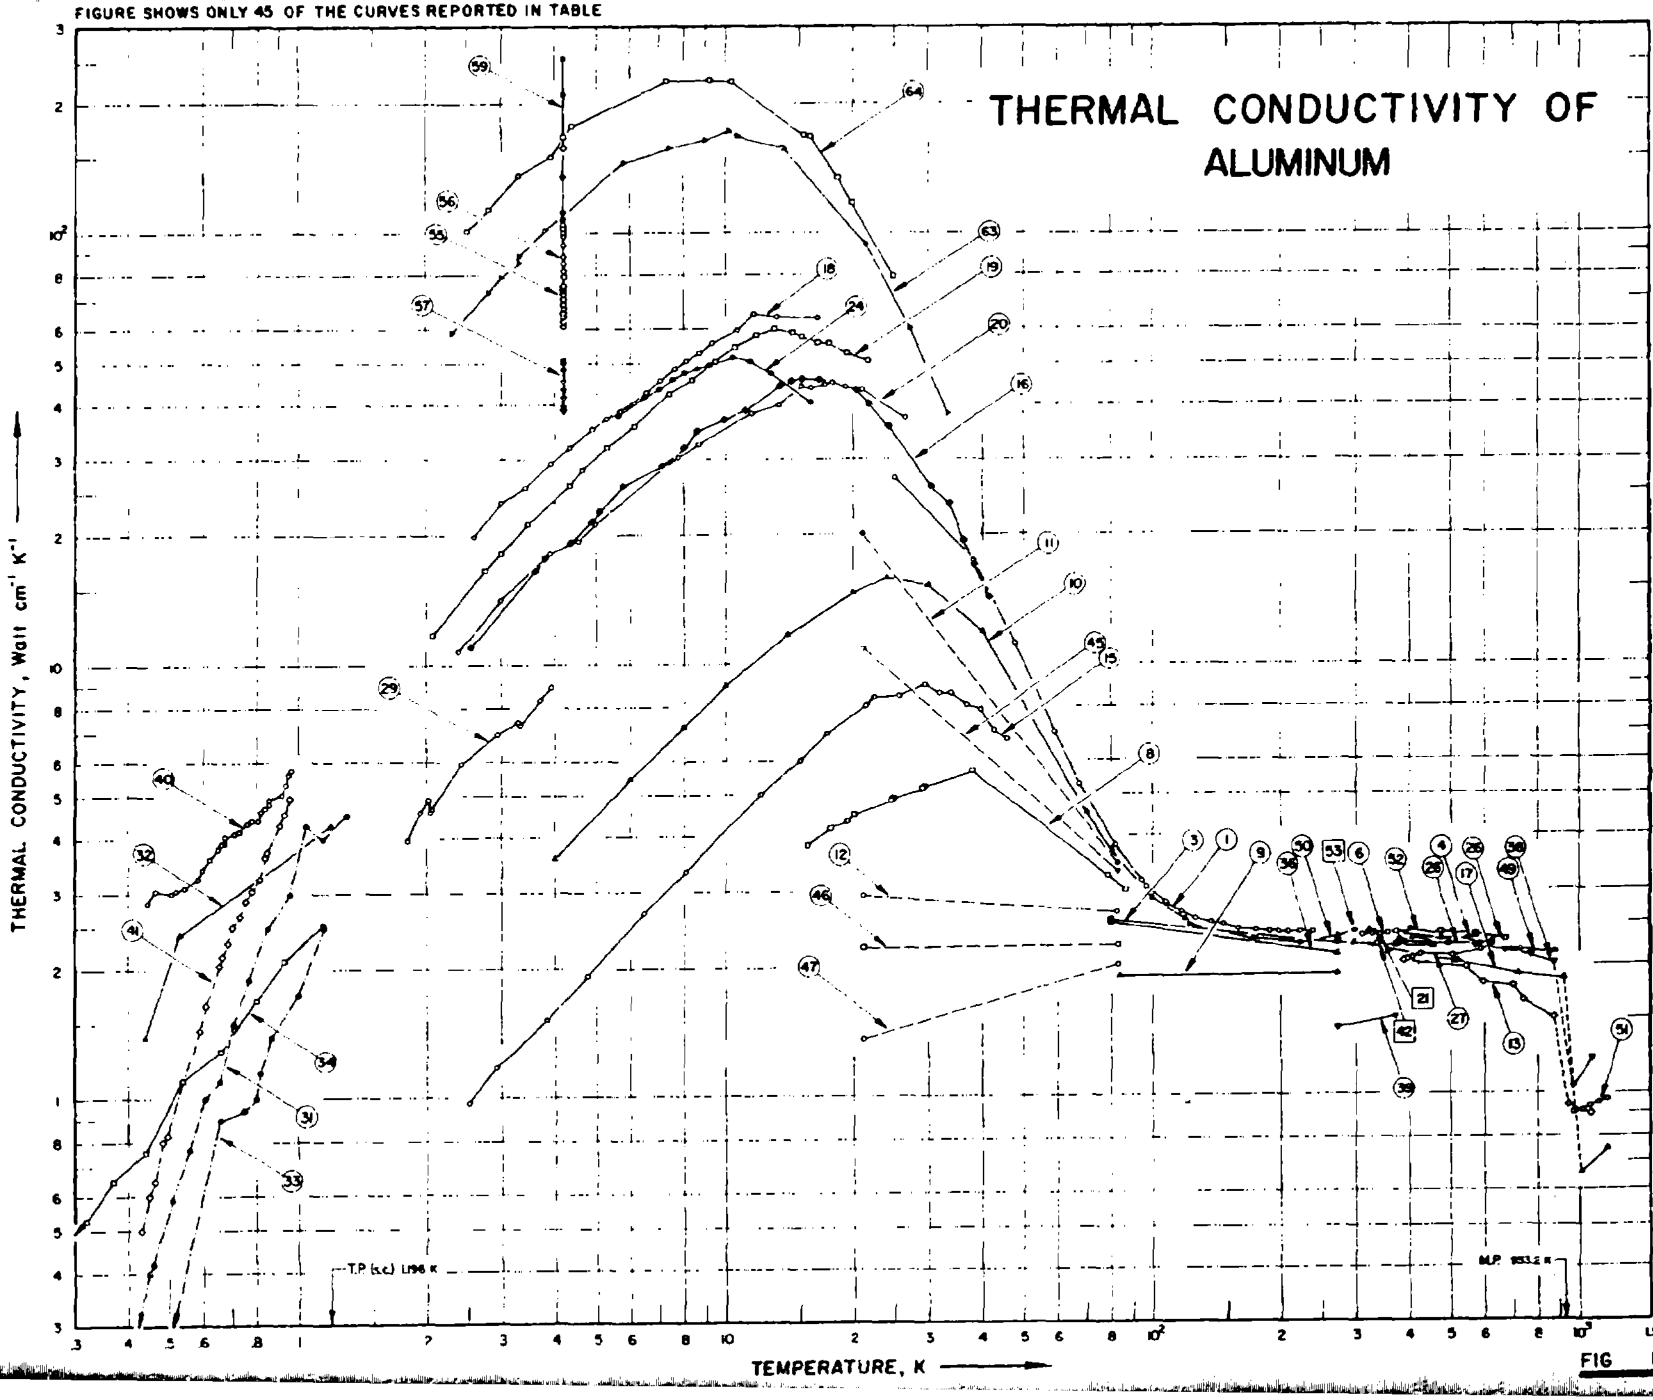

FIG 1

SPECIFICATION TABLE NO. 1 THERMAL CONDUCTIVITY OF ALUMINUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 1]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	114	L	1950	25-238	0.6-1.8		99.99^{+} pure; 0.5 in. dia x 20 in. long; supplied by Aluminum Company of America; cold-drawn with 55% reduction in dia; measured in a vacuum of < 10^{-5} mm Hg.
2	504	P	1961	295.2	±5		Pure; 1.9 x 1.9 x 0.352 cm; thermal conductivity value calculated from measured data of thermal diffusivity and heat capacity and the density value take from Smithsonian Physical Tables (9th ed., 1954).
3	850, 93	L	1929	80-460	3-4		Extremely pure; electrical resistivity reported as 0.725, 2.700, 3.922, and 5.160 μohm cm at 89, 273, 374, and 476 K, respectively.
4	20	L	1951	379-570	3		99.92 Al, 0.04 Si, 0.03 Fe, 0.006 Cu, 0.005 Ti; annealed at 450 C.
5	53	E	1927	353-423	1		High purity.
6	17	L	1958	311-357	1		99.986 Al, 0.0062 Si, 0.0045 Fe, 0.003 Cu, and 0.0001 Mg; 50 mm dia x 70 mm high; manufactured by Metallgesellschoft AG; density 2.691 g cm^{-3} at 20 C.
7	491	C	1948	94-147			99.99^{+} pure; supplied by Aluminum Company of America; aluminum used as comparative material.
8	104	L	1951	16-87			High purity; as rolled; measured in a vacuum of < 5 x 10^{-6} mm Hg.
9	619	L	1916	85,273			Commercial aluminum; 0.5 cm dia x 5 cm long; measured in vacuum.
10	524	L	1957	4.0-120		JM 340	99.995 pure; single crystal; specimen axis inclined 6°, 40°, and 50° to [001], [011], and [111] direction, respectively; a rod of dia 3.68 mm made by Horizons Inc.; ground down to 3.66 mm in dia, then annealed in vacuum at ~400 C for two hours; electrical resistivity reported as 0.025, 0.026, 0.028, 0.065, 0.45, and 2.7 μohm cm at 4, 10, 20, 40, 100, and 300 K, respectively.
11	57	L	1927	21, 83		Al-1	Pure; 7 cm long bar specimen obtained from Aluminum Company of America; annealed in vacuo at 300 C for 2.5 hrs; electrical resistivity reported as 0.0188, 0.3065, and 2.50 μohm cm at -252, -190, and 0 C, respectively.
12	57	L	1927	21, 83		Al-100	Commercial aluminum; annealed in vacuo at 250 C; electrical resistivity reported as 0.1577, 0.458, and 2.65 μohm cm at -252, -190, and 0 C, respectively.
13	85	L	1919	389-1073			Pure.
14	127	L	1925	382-645			99.7 pure; supplied by British Aluminum Co., Ltd.; billets 6.75 in. in dia cast from a maximum temperature of 700 C, annealed at 500 C for 2.5 hrs, extruded at 420 C to 0.75 in. dia, then annealed at 450 C for 2.5 hrs; density 2.70 g cm^{-3} at 21 C; electrical resistivity reported as 2.83, 2.79, 2.81, 3.45, 3.53, 3.53, 4.47, 4.48, 6.15, 6.23, 6.24, 7.39, 8.77, 8.79, and 9.31 μohm cm at 16.2, 16.8, 16.8, 73.0, 77.0, 79.0, 160.0, 161.0, 302.7, 304.4, 306.2, 399.0, 500.0, 502.4, and 540.7 C, respectively.
15	97	L	1952	2.5-46	2-3	JM 4899	99.994 pure; polycrystalline; 1 ~ 2 mm dia x 5 cm long; supplied by Johnson-Matthey Co.; annealed.

SPECIFICATION TABLE NO. 1 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	122		1955	2.6-42	3	JM-4899	99.994 pure; polycrystalline; 0.394 mm dia x 2.97 cm long; supplied by Johnson-Matthey Co.; annealed in vacuum at 600 C for several hrs; electrical resistivity ratio ρ(293 K)/ρ(20 K) = 279.
17	15	F	1947	298-1173	1-5	Al-1	99.95 pure; [illegible] cm dia x [illegible] m long.
18	3	L	1951	2.6-17	4	Al-1	99.996$^+$ Al, 0.001 Mg, 0.001 Si, 0.0006 Fe, 0.0004 Cu, and 0.0004 Na; single crystal; 0.15 in. dia x 4 in. long; supplied by Aluminum Company of America; residual electrical resistivity ρ_r = 0.00304 μohm cm; electrical resistivity ratio ρ(273 K)/ρ(4.2 K) = 840.
19	3	L	1951	2.1-22	4	Al-2	Similar to the above specimen except ρ_r = 0.00385 μohm cm and ρ(273 K)/ρ(4.2 K) = 676.
20	3	L	1951	2.4-27	4	Al-3	99.995$^+$ Al, 0.002 Mg, 0.001 Si, traces of Fe, Cu, and Na; polycrystal, same dimensions and supplier as the above specimen; ρ_r = 0.00553 μohm cm; ρ(273 K)/ρ(4.2 K) = 467.
21	276	C	1953	343.2	3	25-Al	Density 2.7 g cm^{-3}; Armco iron used as comparative material.
22	230	L	1925	326			99.97$^+$ pure; 1.9 cm dia x 10 cm long; electrical conductivity 33.8 x 10^4 ohm^{-1}cm^{-1} at 23 C.
23	400	L	1950	0.36-0.81		Al-2	Polycrystalline; in superconducting state.
24	404	L	1950	2.6-16	4		99.996$^+$ pure; single crystal; supplied by Aluminum Company of America; machined and then etched; crystal slightly damaged by machining.
25	405	E	1940	398-583	± 1		99.992 Al, 0.0030 Fe, 0.0027 Si, and 0.0024 Cu; cast at 700 C in a mold and cooled to 200 C, rolled to 15 mm dia, drawn to 12.5 mm dia, then reduced to 6.5 mm dia.
26	405	E	1940	383-628	± 1		99.93 Al, 0.038 Fe, 0.03 Si, and 0.0022 Cu; same fabrication method as above.
27	405	E	1940	399-623	± 1		99.5 Al, impurities unknown; same fabrication method as above.
28	406	C	1922	313.2	5		99.7 pure; cylindrical specimen of 3 cm long; zinc used as comparative material.
29	498	L	1955	1.8-3.9			99.998 pure; 2.00 mm dia x 9.88 cm long; annealed in vacuo for 5 hrs at 500 C.
30	410	R	1935	273.2	1	Al-1	99.7 pure; electrical conductivity 37.10 x 10^4 ohm^{-1}cm^{-1} at 0 C.
31	409	L	1958	0.13-1.3	10	Al-1	0.01 impurity; with large crystals; annealed in vacuum for 4 hrs at about 600 C; measured in a magnetic field of 0.2 oersted; in superconducting state.
32	409	L	1958	0.44-2.2	10	Al-1	The above specimen in normal state; measured in a longitudinal magnetic field of 115 oersted.
33	409	L	1958	0.16-1.2	10	Al-2	Same specification as the above specimen Al-1; in superconducting state.
34	409	L	1958	0.21-1.2	10	Al-2	The above specimen in normal state.
35	495	L	1949	38-238			99.99$^+$ pure; 0.5 in. rod specimen; supplied by Aluminum Company of America; cold-drawn.
36	496	C	1940	80.273	1		Pure; 4.00 mm dia x 60.0 mm long.
37	497	L	1949	25-82			99.99$^+$ pure; supplied by Aluminum company of America; cold-drawn.

SPECIFICATION TABLE NO. 1 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
38	490	F	1950	273-1073			99.996 pure; tube specimen of 1.2 in. long with a bore of 0.25 in.; manufactured from Norton's RA 99 material.
39	706	L	1891	273, 373			Electrical conductivity 22.46 and 17.31 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively (the author reported 22.46 and 17.31 x 10^5 $ohm^{-1}cm^{-1}$, probably a typographical error).
40	736	L	1965	0.45-0.97			Pure aluminum wire; in normal state.
41	736		1965	0.43-0.96			The above specimen measured in superconducting state.
42	591	C	1963	338.2	± 0.4		0.15 U; 0.500 in. dia x 3 in. long; prepared by dissolution of reactor grade uranium (99.5^+ pure) in aluminum (99.99 pure) at ~ 100 C above the alloy liquidus temperatures, cast in a graphite mould at 100 C, machined to required dimensions; measured in a vacuum of < 5 x 10^{-4} mm Hg; copper used as comparative material.
43	591	C	1963	338.2			Similar to above except specimen heat treated at 620 C for 5 days.
44	591	C	1963	338.2	± 1.4		99.99 pure; extruded.
45	57	L	1927	21.83		Al-3	From same cast piece as Al-1 (curve 11); drawn and annealed 2.5% stretched, recrystallized by annealing; grain size 5 to 15 mm long; electrical resistivity reported as 0.0351, 0.319, and 2.52 μohm cm at -252, -190, and 0 C, respectively.
46	57	L	1927	21.83		Al-101	Same material as Al-100 (curve 12); tempered then 3% stetched, recrystallized by annealing; thermal conductivity measuring length = 2 crystal grains; electrical resistivity reported as 0.219, 0.525, and 2.72 μohm cm at -252, -190, and 0 C, respectively.
47	57	L	1927	21.83		Al-21	Moderately pure; single crystal; grown by recrystallization; electrical resistivity reported as 0.340, 0.663, and 2.84 μohm cm at -252, -190, and 0 C, respectively.
48	659	C	1965	313-673		S.P.	S.P. (super pure) aluminum rod from British Aluminum Co.; specimen 2.53 cm in dia and 20.4 cm long; electrical resistivity reported as 2.86 and 7.12 μohm cm at 40 and 400 C, respectively; Armco iron used as comparative material.
49	659	L	1965	323-873		S.P.	S.P. (super pure) aluminum; 99.993 pure; from British Aluminum Co.; specimen 2.31 cm in dia and 28.0 cm long; electrical resistivity reported as 2.98 and 9.92 μohm cm at 50 and 600 C, respectively.
50	659	L	1965	123-323		S.P.	S.P. (super pure) aluminum from British Aluminum Co.; specimen 8.0 x 0.44 x 0.44 cm; electrical resistivity reported as 0.74 and 3.02 μohm cm at -150 and 50 C, respectively.
51	658	C	1965	973-1273		S.P.	S.P. (super pure) aluminum from British Aluminum Co.; in molten state; electrical resistivity reported as 26.3 and 30.9 μohm cm at 700 and 1000 C, respectively; Morgan Crucible Co. grade EY 9 graphite used as compartive material.
52	617		1957	338-797			99.99 pure; polycrystal; electrical resistivity reported as 3.15, 4.65, 6.82, and 9.14 μohm cm at 64.8, 184, 357.8, and 523.4 C, respectively; Lorenz function reported as 2.34, 2.40, 2.39, and 2.41 x 10^{-8} V^2K^{-2} at 64.8, 184, 357.8, and 523.4 C, respectively.

SPECIFICATION TABLE NO. 1 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
53	765	C	1957	298.2			Super-pure; thermal comparator applied on the machined curved surface of the 1 in. dia bar specimen.
54	765	C	1957	298.2			Thermal comparator loaded with 100 gram weight s on the plane lapped surface of the specimen.
55	330	L	1965	4.2	2-3	Sp 1	80 x 5 x 0.066 mm; made from a zone-refined material, cold-rolled and then annealed in air for 24 hrs at 460-500 C; electrical resistivity reported as 0.000538 μohm cm at 4.2 K; measured in magnetic fields of strength ranging from 0.94 to 12.8 kOe perpendicular to the specimen surface.
56	330	L	1965	4.2	2-3	Sp 1	The above specimen measured in transverse co-planar magnetic fields of strength ranging from 0 to 13.0 kOe.
57	330	L	1965	4.2	2-3	Sp 2	80 x 5 x 0.035 mm; same source and fabrication method as the above specimen; electrical resistivity reported as 0.00103 μohm cm at 4.2 K; measured in magnetic fields of strength ranging from 0 to 12.7 kOe perpendicular to the specimen surface.
58	330	L	1965	4.2	2-3	Sp 2	The above specimen measured in transverse co-planar magnetic fields of strength ranging from 0 to 12.8 kOe.
59	330	L	1965	4.2	2-3	Sp 3	80 x 5 x 0.129 mm; same source and fabrication method as the above specimen; electrical resistivity reported as 0.000402 μ ohm cm at 4.2 K; measured in magnetic fields of strength ranging from 0 to 10.7 kOe perpendicular to the specimen surface.
60	330	L	1965	4.2	2-3	Sp 3	The above specimen measured in transverse co-planar magnetic fields of strength ranging from 0 to 5.98 kOe.
61	330	L	1965	4.2	2-3	Sp 4	80 x 5 x 0.081 mm; same source and fabrication method as the above specimen; bulk electrical resistivity reported as 0.000595 μohm cm at 4.2 K; measured in magnetic fields of strength ranging from 0 to 13.2 kOe perpendicular to the specimen surface.
62	330	L	1965	4.2	2-3	Sp 4	The above specimen measured in transverse co-planar magnetic fields of strength ranging from 0 to 10.3 kOe.
63	570	L	1963	2-33	1.5	Al_3	99.9999 pure; specimen made from zone-refined Al, 0.125 in. in dia and about 6 cm long; supplied by Consolidated Mining and Smelting Co. of Canada; drawn and etched; residual electrical resistivity ρ_0 0.000903 μohm cm.
64	570	L	1963	3-25	1.5	Al_4	Similar to the above specimen except ρ_0 0.000568 μohm cm.
65	843	P	1966	298.2			Grained ingot supplied by Alcoa Aluminum Co.; mesh size -30 + 45; specimen contained in a 0.75 in. dia x 2 in. long stainless steel cylindrical cell; thermal conductivity measured by using the transient line source method; measured in argon under a pressure of ~ 100 psig.
66	843	P	1966	298.2			Similar to above; measured in nitrogen under a pressure of ~ 100 psig.

REMARKS

The recommended values are for well-annealed 99.9999% pure aluminum with residual electrical resistivity ρ_0 = 0.000593 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, a = 0.61, m = 2.61, α'' = 4.87 x 10^{-6}, and β = 0.0245. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 2 to 3% of the true values near room temperature and 3 to 5% at other temperatures.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated or estimated.

SPECIFICATION TABLE NO. 2 THERMAL CONDUCTIVITY OF ANTIMONY

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 2]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	35	L	1912	83-273			Pure; cold-drawn.
2	49	L	1913	83-373			Pure.
3	85	L	1919	386-965			No details reported.
4	122	L	1955	2.4-35		Sb 1	Polycrystalline; extruded wire; 1.625 cm long, 0.163 cm dia; made from Johnson Matthey Spectrographically Standardized Metals; annealed at 500 C in vacuo for 2 hrs.
5	424	L	1956	2.0-135		Sb 1	High purity polycrystalline specimen; 0.43 x 0.25 x 6 cm; sawn from a lump of extra high purity grade antimony supplied by Bradley Mining Co.; electrical resistivity 47.7 μohm cm at 295 K; residual electrical resistivity 0.057 μohm cm.
6	424	L	1958	2.0-91		Sb 2	High purity polycrystalline specimen; 5 mm dia, 6 cm long; crystal width 2 to 5 mm; supplied by Bradley Mining Co.; prepared by zone-refining high purity grade antimony; annealed at 600 C for one wk; electrical resistivity 41.3 μohm cm at 295 K; residual electrical resistivity 0.054 μohm cm.
7	424	L	1958	4.4-91		Sb 2a	Second run of the above specimen.
8	425	L	1924	90, 273	5		Polycrystalline specimen with fine grains; cast at 200 C; electrical conductivity at 90 and 273 K being 8.34 and 2.43 x 10^4 ohm^{-1} cm^{-1} respectively.
9	425	L	1924	90, 273	5		Polycrystalline specimen with fine grains; electrical conductivity at 90 and 273 K being 8.13 and 2.38 x 10^4 ohm^{-1} cm^{-1} respectively.
10	425	L	1924	90, 273	5		Polycrystalline specimen with medium size grains; electrical conductivity at 90 and 273 K being 8.08 and 2.35 x 10^4 ohm^{-1} cm^{-1} respectively.
11	425	L	1924	90, 273	5		Polycrystalline specimen with coarse grains; electrical conductivity at 90 and 273 K being 7.89 and 2.32 x 10^4 ohm^{-1} cm^{-1} respectively.
12	230	L	1925	327.2			Total impurity less than .03%; made from Baker's Analyzed Metal.
13	426	L	1947	91.2		P_I	Single crystal cylinder specimen; longitudinal axis of the specimen parallel to the z-axis of the crystal; supplied by Kahlbaum; electrical resistivity 26.26 μohm cm at 0 C; measured at 91.2 K in magnetic fields ranging from 0 to 11.6 kilooersteds.
14	426	L	1947	79.5		P_I	The above specimen similarly measured at a temp of 79.5 K.
15	426	L	1947	91.2		S 14	Similar to the above specimen except longitudinal axis of the specimen perpendicular to z- and x-axis of the crystal; electrical resistivity 37.11 μohm cm at 0 C; measured at 91.2 K.
16	426	L	1947	79.5		S 14	The above specimen similarly measured at 79.5 K.
17	426	L	1947	91.2		S 10	Similar to the above specimen except longitudinal axis perpendicular to z-axis and parallel to x-axis of the crystal; measured at 91.2 K in magnetic fields of 0 to 11.6 kilooersteds.

SPECIFICATION TABLE NO. 2 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
18	426	L	1947	81.2		S 10	The above specimen similarly measured at a temp of 81.2 K.
19	577	L	1913	193-373			Specimen pressed from powder at 5000 Kg cm^{-2} for 1 hr; antimony supplied by C. A. F. Kahlbaum.
20	577	L	1913	273, 373			Similar to the above specimen except pressed at 2500 Kg cm^{-2} for 1 hr.
21	511	L	1918	297			Specimen 0.45 cm dia; supplied by Erba; measured under 1.0 atm pressure.
22	706	L	1881	273, 373			Electrical conductivity at 273 and 373 K being 2.199 and 1.522 x 10^4 ohm^{-1} cm^{-1} respectively (the paper gives electrical resistivity values as 2.199 and 1.522 x 10^5 ohm^{-1} cm^{-1}, obviously a typographical error).
23	838	C	1967	825-1023			Molten metal placed in a hole 21 mm in dia drilled in an asbestos cement cylinder 30 mm in height; steel 1Kh18N9T used as comparative material.
24	319, 320	P	1966	1073.2	8		Molten specimen contained in a thin-walled stainless steel cylindrical crucible of dimensions 24 mm dia x 100 mm long; electrical resistivity reported as 82.9, 90.2, and 100 µohm cm at 620, 700, and 800 C respectively; thermal conductivity values calculated from measured thermal diffusivity and the specific heat data using the density data taken from Bienias, A. and Sauerwald, F. (Z. Anorg. Chem., 41, 51, 1927).

REMARKS

The recommended values are for well-annealed high-purity antimony with residual electrical resistivity $\rho_0 = 0.054$ $\mu\Omega$ cm (characterization by ρ_0 becomes important below room temperature). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

[For Data Reported in Figure and Table No. 4]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	111	C	1953	323-673		Vi-A.R.	Specimen 1 x 1 x 6.6 cm; spectral analysis showed Mg, Ca, Ba, Si, Fe, Cu, Ti, Al and Mn as impurities; prepared from a block of beryllium by American G.E.C.; sintered; density 1.83 g cm^{-3}; electrical resistivity reported as 5.2, 6.2, 7.7, 10.9, 14.5, 18.2, 22.2, 26.4, and 30.8 μohm cm at 20, 50, 100, 200, 300, 400, 500, 600, and 700 C, respectively.
2	111	C	1953	323-673		Vi-H.T.	The above specimen heat treated at 700 C; electrical resistivity reported as 4.1, 5.0, 6.6, 9.9, 13.5, 17.1, 20.9, 25.2 and 29.9 μohm cm at 20, 50, 100, 200, 300, 400, 500, 600, and 700 C, respectively.
3	122	L	1955	1.8-38	2-3	Be-1	Pure specimen; 2.01 cm long, 0.231 cm dia; made from beryllium powder supplied by Atomic Energy Research Establishment; compressed and sintered at 1100 C in vacuo for several hrs; electrical resistivity ratio $\rho(293K)/\rho(20K)$ = 352.
4	56	L	1940	23-81		Be-3	Single crystal; heat flow perpendicular to hexagonal axis; electrical resistivity reported as 0.0078, 0.0452, and 0.0755 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
5	56	L	1940	23-91		Be-4	Single crystal; electrical resistivity reported as 0.0124, 0.0537, and 0.0868 μohm cm at 20.37, 77.83, and 90.29 K, respectively; heat flow perpendicular to hexagonal axis.
6	56	L	1940	23-91		Be-8	Single crystal; electrical resistivity reported as 0.0076, 0.0473, and 0.0770 μohm cm at 20.34, 77.95, and 89.80 K, respectively; heat flow perpendicular to hexagonal axis.
7	278	F	1929	97-464	3-6		Commercially pure specimen; traces of Al, Mg, Cr, Fe, Si, and Mg; ~0.5 total impurities; 21 cm long, 1 cm in dia; supplied by Beryllium Co. of America; electrical resistivity reported as 1.50, 6.45, 14.64, 22.45, 32.45, and 39.00 μohm cm at 84, 294, 496, 674, 880, and 973 K, respectively.
8	753		1959	319.2			Vacuum cast.
9	235	L	1944	307-338			Pure; 2.553 cm long, 5.047 cm^2 cross-sectional area.
10	436	L	1938	23, 80		Be 2	Single crystal; hexagonal parallelepiped; supplied by Degussa Co.; length 1.6 cm; hexagonal cross section 0.00648 cm^2; electrical resistivity reported as 0.00458, 0.00454, and 3.58 μohm cm at 20.33, 79.02, and 273.15 K, respectively; density 1.84 g cm^{-3}; heat flow parallel to the hexagonal axis.
11	436	L	1938	23-81		Be 2	The above specimen measured at H (the transverse magnetic field strength) = 4490 oersteds and at θ (angle of rotation of the magnetic field in a plane perpendicular to the specimen axis) = -6°; H perpendicular to one of the binary lateral axes.
12	436	L	1938	23, 81		Be 2	The above specimen measured at H = 8750 oersteds and at θ = -6°.
13	436	L	1938	23, 81		Be 2	The above specimen measured at H = 10880 oersteds and at θ = -6°.
14	436	L	1938	23, 70		Be 2	The above specimen measured at H = 2280 oersteds and at θ = -6°.

SPECIFICATION TABLE NO. 4 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
15	436	L	1938	22.50		Be 2	The above specimen measured at H = 12200 oersteds and at $\theta = -6°$.
16	436	L	1938	23.81		Be 2	The above specimen measured at H = 10880 oersteds and at $\theta = +24°$ at which H is parallel to one of the binary lateral axes.
17	436	L	1938	23.70		Be 2	The above specimen measured at H = 2280 oersteds and at $\theta = +24°$.
18	436	L	1938	23.45		Be 2	The above specimen measured at H = 4490 oersteds and at $\theta = +24°$.
19	436	L	1938	23.40		Be 2	The above specimen measured at H = 8750 oersteds and at $\theta = +24°$.
20	436	L	1938	23.50		Be 2	The above specimen measured at H = 12200 oersteds and at $\theta = +24°$.
21	355	L	1955	9-102		Be 2	High purity, <0.1 Mg and trace of Fe; specimen 4 mm in dia; machined from a sintered rod of high purity beryllium; electrical resistivity at 295 K being 4.95 μohm cm; residual resistivity (extrapolated to 0 K) 1.20 μohm cm.
22	753		1959	363-573			Powder; sintered.
23	753		1959	499-840			Vacuum cast; extruded.
24	753		1959	476-840			Flake, extruded.
25	990	L	1942	92.1		Be 2	Single crystal; hexagonal parallelepiped; supplied by Degussa Co.; length 1.6 cm, hexagonal cross-section 0.00648 cm^2; electrical resistivity reported as 0.0450, 0.0763, and 3.58 μohm cm at 79.0, 90.2, and 273.2 K, respectively; density 1.84 g cm^{-3}; measured in magnetic field of strength 0 to 11.7 k Oe at θ (angle of rotation of magnetic field in a plane perpendicular to the specimen axis) = $-53°$ with the magnetic field perpendicular to one of the binary lateral axes.
26	990	L	1942	92.1		Be 2	The above specimen measured at $\theta = -23°$ and with the magnetic field parallel to one of the binary lateral axes.
27	56	L	1940	23.81		Be 3	Single crystal; electrical resistivity reported as 0.0835, 0.0789, and 0.1002 μohm cm at 20.36, 78.00, and 90.17 K, respectively; heat flow perpendicular to the hexagonal axis z; measured in a magnetic field of strength 3.4 kOe perpendicular to z.
28	56	L	1940	23.81		Be 3	The above specimen measured with the magnetic field of strength 3.4 kOe parallel to z; electrical resistivity reported as 0.1349, 0.0946, and 0.1114 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
29	56	L	1940	80.6		Be 3	The above specimen measured in a magnetic field of strength 6.8 kOe perpendicular to z; electrical resistivity reported as 0.2037, 0.1465, and 0.1444 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
30	56	L	1940	23.81		Be 3	The above specimen measured with the magnetic field of strength 6.8 kOe parallel to z; electrical resistivity reported as 0.3367, 0.1740, and 0.1756 μohm cm at 20.36, 78.00, and 90.17 K, respectively.

SPECIFICATION TABLE NO. 4 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
31	56	L	1940	23, 81		Be 3	The above specimen measured in a magnetic field of strength 10.1 kOe perpendicular to z; electrical resistivity reported as 0.4829, 0.2422, and 0.2074 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
32	56	L	1940	23, 81		Be 3	The above specimen measured with the magnetic field of strength 10.1 kOe parallel to z; electrical resistivity reported as 0.6137, 0.2707, and 0.2533 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
33	56	L	1940	23, 81		Be 3	The above specimen measured with the magnetic field of strength 11.7 kOe perpendicular to z; electrical resistivity reported as 0.6271, 0.2992, and 0.2435 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
34	56	L	1940	23, 81		Be 3	The above specimen measured with the magnetic field of strength 11.7 kOe parallel to z; electrical resistivity reported as 0.7755, 0.3210, and 0.2968 μohm cm at 20.36, 78.00, and 90.17 K, respectively.
35	56	L	1940	79.0		Be 4	Single crystal; electrical resistivity reported as 0.0746, 0.0865, and 0.1114 μohm cm at 20.37, 77.83, and 90.29 K, respectively; heat flow perpendicular to z; measured in a magnetic field of strength 3.4 kOe perpendicular to z.
36	56	L	1940	79.0		Be 4	The above specimen measured with the magnetic field of strength 3.4 kOe parallel to z; electrical resistivity reported as 0.1226, 0.1038, and 0.1240 μohm cm at 20.37, 77.83, and 90.29 K, respectively.
37	56	L	1940	23, 79		Be 4	The above specimen measured in a magnetic field of strength 6.8 kOe perpendicular to z; electrical resistivity reported as 0.1989 and 0.1508 μohm cm at 20.37 and 77.83 K, respectively.
38	56	L	1940	23, 79		Be 4	The above specimen measured with the magnetic field of strength 6.8 kOe parallel to z; electrical resistivity reported as 0.2847 and 0.1886 μohm cm at 20.37 and 77.83 K, respectively.
39	56	L	1940	23-91		Be 4	The above specimen measured in a magnetic field of strength 10.1 kOe perpendicular to z; electrical resistivity reported as 0.3754, 0.2437, and 0.2184 μohm cm at 20.37, 77.83, and 90.29 K, respectively.
40	56	L	1940	23-91		Be 4	The above specimen measured with the magnetic field of strength 10.1 kOe parallel to z; electrical resistivity reported as 0.4939, 0.2934, and 0.2763 μohm cm at 20.37, 77.83, and 90.29 K, respectively.
41	56	L	1940	23-91		Be 4	The above specimen measured in a magnetic field of strength 11.7 kOe perpendicular to z; electrical resistivity reported as 0.480, 0.2972, and 0.2548 μohm cm at 20.37, 77.83, and 90.29 K, respectively.
42	56	L	1940	23-91		Be 4	The above specimen measured with the magnetic field of strength 11.7 kOe parallel to z; electrical resistivity reported as 0.612, 0.345, and 0.3228 μohm cm at 20.37, 77.83, and 90.29 K, respectively.

REMARKS

The recommended values are for well-annealed high-purity beryllium with residual electrical resistivity ρ_0 = 0.0135 $\mu\Omega$ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.80, α' = 2.56 x 10^{-5}, and β = 0.553. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

---

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu lb^{-1} ft^{-1} F^{-1}. ‡ Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 5 THERMAL CONDUCTIVITY OF BISMUTH

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 5]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	128	L	1944	2.3-76	1		Highly purified; single crystal; cylindrical specimen of 7.5 cm long and 0.1 cm^2 cross-sectional area; supplied by Hilger Co.; electrical resistivity ratio $\rho(T)/\rho(0C)$ = 0.320, 0.0725, 0.039 and 0.019 at 77, 35, 20.4, 14.1 and 4.2 K, respectively.
2	77	E	1900	291, 373			Impurities, < 0.03 ~~each of Pb and Fe~~ (Fe + Pb); cast wire, 8.95 cm long, 1.795 cm dia; density 9.78 g cm^{-3} at 18 C; electrical conductivity at 18 and 100 C being 0.840 and 0.624 x 10^4 $ohm^{-1}cm^{-1}$, respectively.
3	126, 324	F	1955	293-373	5		Pure; cast from granular bismuth; electrical conductivity 7360, 6760, 6330, 5920, 5500 $ohm^{-1}cm^{-1}$ at 293, 313, 333, 353, and 373 K, respectively.
4	113	C	1957	573-623			High purity; molten metal; contained in a cavity 3.5 in. long, 0.94 in. dia; electrical resistivity 128.6, 131.1, 1[illegible].6, 136.0 and 138.5 µohm cm at 300, 350, 400, 450 and 500 C respectively; stainless steel used as comparative material.
5	49	L	1913	83-373			Pure; electrical conductivity reported as 2.640, 1.190, 0.915, and 0.612 x 10^4 ohm^{-1} cm^{-1} at -190, -77, 0, and 100 C, respectively.
6	61	L	1936	19-83	5	PZ 2	99.997 Bi, 0.002 Ag, traces of Pb and Cu; single crystal; length 3 cm, cross-sectional area 0.1 cm^2; crystal grown from 'Bi 9506 bismuth' supplied by Adam Hilger Ltd., London; heat flow parallel to trigonal axis; electrical resistivity ratio $\rho(T)/\rho(0C)$ = 0.0711, 0.0634 and 0.0452 at 20.37, 18.47 and 14.15 K, respectively.
7	61	L	1936	19-81	5	PZ 4	99.998 Bi; 0.001 Ag; trace of Pb; single crystal; length 3 cm, cross-sectional area 0.1 cm^2; crystal grown from 'Bi 10283 bismuth' supplied by Adam Hilger Ltd., London, heat flow parallel to trigonal axis; $\rho(T)/\rho(0C)$ = 0.244, 0.0540, 0.0474, and 0.0324 at 70.85, 20.37, 18.47 and 14.15 K, respectively.
8	85	L	1919	362-857			Cylindrical specimen.
9	120	L	1934	112-228		No. 1	High purity; single crystal; specimen 1.231 cm in length and cross-section roughly triangular in shape with dimensions ~ 3 mm on a side; specimen prepared at California Institute of Technology; heat flow parallel to trigonal axis; measured in vacuum of 10^{-6} mm Hg.
10	120	L	1934	105-208		No. 2	High purity; single crystal; specimen 1.3 cm long and similar in form to No. 1; specimen prepared at California Institute of Technology; heat flow perpendicular to trigonal axis; measured in a vacuum of 10^{-6} mm Hg.
11	1008	L	1934	17-81		P	99.995 Bi; major impurity, Ag; single crystal; specimen consisted of two rods each of size 28 x 5 x 5 mm; grown from H.S. Brand, Laboratory No. 8016 bismuth, supplied by Adam Hilger Ltd., London; heat flow parallel to trigonal axis (the specimen axis).
12	60	L	1934	17-81		S_1	99.995 Bi; major impurity, Ag; single crystal; specimen consisted of two rods each of size 28 x 5.8 x 4.5 mm; grown from material supplied by Adam Hilger Ltd., London; material melted and pressed into mould to be in contact with a seed crystal, then cooled slowly to crystalize; heat flow parallel to a binary axis.

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
13	60	L	1934	17-81		S_2	Similar to the above specimen except heat flow parallel to a bisectrix between two binary axes.
14	277	L	1939	298-423		Bi-1	High purity; spectroscopic examination showing traces of Pb and Cu; single crystal; specimen cut in the form of disks 25 mm in dia and 2 mm thick from a large crystal grown by Bridgman's method; supplied by Kahlbaum; density 9.78 g cm^{-3} at room temp, electrical resistivity reported as 114 μohm cm at 25 C; heat flow perpendicular to trigonal axis. (Data extracted from smooth curve.)
15	277	L	1939	298-423		Bi-2	Similar to the above specimen except electrical resistivity 144 μ ohm cm at 25 C and heat flow parallel to trigonal axis.
16	424	L	1958	2-80	1	Bi-1	99.97 pure when received; specimen 2 mm dia, 6 cm long, it contained columnar crystals penetrating to the centre of the rod, 16 to 18 crystals being exposed on the circular section; metal supplied by Mining and Chemical Products (London); cast and cooled quickly; residual electrical resistivity ρ_0 = 104 μohm cm; ρ(295K) = 136 μ ohm cm.
17	424	L	1958	2-91	1	Bi-2	99.99 pure; 6 columnar crystals per circular section; specimen 3 mm dia, 6 cm long; granular bismuth supplied by the General Chemical Division of Allied Chemical and Dye Corp.; cast in a brass former, cooled slowly, residual electrical resistivity ρ_0 = 5.9 μ ohm cm; ρ(295 K) = 120 μ ohm cm.
18	424	L	1958	2-78	1	Bi-3	99.999 pure; crystals about 1 cm long and had the lateral dimensions of the rod, specimen about 3.5 mm dia, 6 cm long; bismuth supplied by Varlacoid Chemical Co. of New York, zone-refined and annealed for several days at a temp just below melting point; residual electrical resistivity ρ_0 = 2.07 μohm cm; ρ(295 K, assumed) = 118 μ ohm cm.
19	424	L	1958	2-79	1	Bi-4	99.999 pure; specimen contained about 3 crystals; it had a triangular cross-section of sides 5, 5, and 2.5 mm, 6 cm long, cut from zone-refined bar; supplied by Varlacoid Chemical Co.; residual electrical resistivity ρ_0 = 1.70 μohm cm; ρ(295 K, assumed) = 118 μ ohm cm.
20	424	L	1958	2-91	1	Bi-5	Cut from the same bar as the above specimen; contained crystals 2 to 4 mm wide and 1 to 2 cm long; square cross-section 6 x 6 mm; residual electrical resistivity ρ_0 = 2.4 μ ohm cm; ρ(295 K, assumed) = 118 μ ohm cm.
21	469	L	1923	219			0.02 Pb, trace of Fe; single crystal; 1.842 x 1.023 x 0.168 cm; annealed; heat flow parallel to trigonal axis.
22	469	L	1923	219			Similar to above specimen except dimensions 1.843 x 1.022 x 0.167 cm and heat flow perpendicular to trigonal axis.
23	470	L	1949	287.2		1	Pure single crystal; 0.9114 cm cubic specimen; bismuth supplied by Merch; heat flow parallel to trigonal axis.
24	470	L	1949	287.2		1	The above specimen; heat flow perpendicular to the trigonal axis.

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
25	470	L	1949	287.2		2	Similar to the above specimen except heat flow parallel to the trigonal axis.
26	470	L	1949	287.2		2	The above specimen; heat flow perpendicular to the trigonal axis.
27	470	L	1949	287.2		3	Pure, polycrystalline; cubic specimen 0.93 x 0.93 x 0.93 cm; bismuth supplied by Merck.
28	470	L	1949	287.2		4	Similar to the above specimen.
29	230	L	1925	328.2			Total impurities < 0.03; specimen 10 cm long, 1.9 cm in dia; bismuth from Baker's Analyzed Metal; electrical conductivity 0.84 x 10^4 $ohm^{-1}cm^{-1}$ at 22 C.
30	248	E	1956	313-453	3		99.997 pure.
31	471	L	1903	87-291			Pure; density 9.67, 10.04 and 10.44 g cm^{-3} at 18, -79, and -186 C, respectively; electrical conductivity 0.861, 1.196 and 2.452 x 10^4 $ohm^{-1}cm^{-1}$ at 18, -79, and -186 C, respectively. (Note: the paper gives electrical conductivity as 10^5 ohm^{-1} cm^{-1} which is probably an error)
32	472	L	1937	91.5		Bi 66	Pure; single crystal; the angle between rod axis and trigonal axis Φ = 2°.
33	472	L	1937	91.5		Bi 66	The above specimen measured in a magnetic field approximately parallel to the z-axis and the xz-plane (z-axis coincident with the trigonal axis; x-axis parallel to a diagonal, which does not intersect with the trigonal axis of one face of the crystal i.e., parallel to a two-fold secondary axis, with strength H=650 oersteds.
34	472	L	1937	91.6		Bi 66	The above specimen measured at H=650 oersteds approximately parallel to x-axis.
35	472	L	1937	91.4-91.5		Bi 66	The above specimen measured at H=1500 oersteds (H in xz-plane) and at ψ (angle between H and z-axis) ranging from 0 to -10°.
36	472	L	1937	91.5		Bi 66	The above specimen measured at H=2520 oersteds (H parallel to xz-plane) and at ψ = 0°.
37	472	L	1937	91.7		Bi 66	The above specimen measured at H=2520 oersteds (H parallel to xz-plane) and at ψ = 90°.
38	472	L	1937	91.6		Bi 66	The above specimen measured at H=4850 oersteds (H parallel to xz-plane) and at ψ = 0°.
39	472	L	1937	91.7		Bi 66	The above specimen measured at H=4850 oersteds (H parallel to xz-plane) and at ψ = [illegible].
40	472	L	1937	91.5-91.7		Bi 66	The above specimen measured at H=6100 oersteds (H parallel to xz-plane) and at ψ ranging from 0 to -20°.
41	472	L	1937	91.5		Bi 66	The above specimen measured without magnetic field.
42	472	L	1937	91.6		Bi 66	The above specimen measured in a magnetic field parallel to the yz-plane with H=650 oersteds and ψ = 10° (H approximately parallel to the trigonal axis).
43	472	L	1937	91.8		Bi 66	The above specimen measured at H=650 oersteds (H parallel to yz-plane) and at ψ = 100° (H approximately parallel to y-axis).

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
44	472	L	1937	91.7-92.0		Bi 66	The above specimen measured at H = 1500 oersteds (H parallel to yz-plane) and at ψ ranging from 10 to -80°.
45	472	L	1937	91.37-91.40		Bi 66	The above specimen measured at H = 2520 oersteds (H parallel to yz-plane) and at ψ ranging from 10 to 100°.
46	472	L	1937	91.8		Bi 66	The above specimen measured at H = 4850 oersteds (H parallel to yz-plane) and at ψ = 10°.
47	472	L	1937	92.0		Bi 66	The above specimen measured at H = 4850 oersteds (H parallel to yz-plane) and at ψ = 100°.
48	472	L	1937	91.8-92.0		Bi 66	The above specimen measured at H = 6100 oersteds (H parallel to yz-plane) and at ψ ranging from 10 to -20°.
49	472	L	1937	79.2		Bi 66	The above specimen measured without magnetic field.
50	472	L	1937	80.8		Bi 66	The above specimen measured without magnetic field.
51	472	L	1937	79.2		Bi 66	The above specimen measured at H = 650 oersteds (H parallel to yz-plane) and at ψ = 10°.
52	472	L	1937	79.3		Bi 66	The above specimen measured at H = 650 oersteds (H parallel to yz-plane) and at ψ = 100°.
53	472	L	1937	79.1		Bi 66	The above specimen measured at H = 1500 oersteds (H parallel to yz-plane) and at ψ = 10°.
54	472	L	1937	79.4		Bi 66	The above specimen measured at H = 1500 oersteds (H parallel to yz-plane) and at ψ = 100°.
55	472	L	1937	79.3		Bi 66	The above specimen measured at H = 2520 oersteds (H parallel to yz-plane) and at ψ = 10°.
56	472	L	1937	79.4		Bi 66	The above specimen measured at H = 2520 oersteds (H parallel to yz-plane) and at ψ = 100°.
57	472	L	1937	79.4		Bi 66	The above specimen measured at H = 4850 oersteds (H parallel to yz-plane) and at ψ = 10°.
58	472	L	1937	79.4		Bi 66	The above specimen measured at H = 4850 oersteds (H parallel to yz-plane) and at ψ = 100°.
59	472	L	1937	79.2		Bi 66	The above specimen measured at H = 6100 oersteds (H parallel to yz-plane) and at ψ = 10°.
60	472	L	1937	79.4		Bi 66	The above specimen measured at H = 6100 oersteds (H parallel to yz-plane) and at ψ = 100°.
61	472	L	1937	79.4		Bi 66	The above specimen measured at H = 6100 oersteds (H parallel to yz-plane) and at ψ = -80°.
62	472	L	1937	91.2		Bi 51	Pure, single crystal; the angle between rod axis and trigonal axis Φ = 86°.
63	472	L	1937	91.2-91.5		Bi 51	The above specimen measured in a magnetic field parallel to the plane containing the trigonal axis (z-axis) and the rod axis with strength H = 2520 oersteds and at ψ' (angle between field direction and a line such that at ψ' = 7°, H perpendicular z-axis and at ψ' = 97°, H parallel z-axis) ranging from 8 to -10°.
64	472	L	1937	91.6-91.8		Bi 51	The above specimen measured at H = 6100 oersteds (H parallel to the plane containing z-axis and the rod axis) and at ψ' ranging from 7 to -5°.
65	473	L	1934	80-297		Bi 9	Single crystal; 0.55 cm dia x 3.6 cm long; the angle between rod axis and trigonal axis about 80°; electrical resistivity reported as 46.95, 48.32, 49.41, 103.6 and 112.2 μ ohm cm at -193.92, -188.19, -183.62, 0, and 21.02 C, respectively.

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
66	473	L	1934	81.1		Bi 9	The above specimen measured in a transverse magnetic field (H perpendicular to rod axis) with H (field strength) - 5900 gauss and at θ (the angle between field and rod axis) ranging from 25 to 170°; electrical resistivity at -194.5 C reported as 601, 620, and 458 μ ohm cm at θ = 25°, 35°, and 170°, respectively.
67	473	L	1934	89.4-90.5		Bi 9	The above specimen measured in a transverse magnetic field; H-5900 gauss and θ ranging from 35 to 170°; electrical resistivity at -183.5 C reported as 510, 408, and 391 μ ohm cm at θ = 35, 95 and 170°, respectively.
68	425	L	1924	9[illegible]3	5		Polycrystal with fine grains; electrical conductivity 2.61 and 9.29 x 10^3 $ohm^{-1}cm^{-1}$ at 90 and 273 K respectively. (Note the paper gives 10^4, probably a typographical error.)
69	425	L	1924	90,273	5		Polycrystal with coarse grains; electrical conductivity 2.55 and 8.98 x 10^3 $ohm^{-1}cm^{-1}$ at 90 and 273 K respectively. (Note the paper gives 10^4, probably a typographical error.)
70	368		1954	298.2			Fine-crystalline extruded specimen; concentration of current carriers 8.8 x 10^{18} cm^{-3}; electrical conductivity 6760 $ohm^{-1}cm^{-1}$ at 25 C.
71	431	E	1944	372-501			Pure; polycrystal; electrical resistivity 179.20 to 277.00 μohm cm at 372.3 to 501.1 K.
72	754	L	1963	2.1-4.1			Very pure, single crystal; prepared from spectroscopically pure bismuth; light parallepiped 24.3 x 6.9 x 2.5 mm; obtained from Johnson Matthey and Co.; crystal resistance ratio R(300 K)/R(4.2 K) = 40.
73	474	L	1950	82-90		$Bi-S_4$	Single crystal; rod axis perpendicular to the trigonal axis and approximately parallel to one of the two-fold secondary axes (one side of the base triangle); electrical resistivity reported as 39.93 and 99.4 μohm cm at -187.5 and 0 C, respectively.
74	474	L	1950	83-89		$Bi-S_7$	Single crystal; rod axis perpendicular to trigonal axis and perpendicular to one of the two-fold secondary axes (one side of the base triangle); electrical resistivity reported as 40.18 and 100.7 μohm cm at -187.5 and 0 C, respectively.
75	475	L	1936	78,90		Bi 66	Pure; single crystal; the angle between trigonal axis and rod axis ϕ = 2°; 3 mm dia x 4 ~ 5 cm long; electrical resistivity reported as 36.1, 41.0 and 127.4 μ ohm cm at -195.39, -182.98 and 0 C, respectively.
76	475	L	1936	78,90		Bi 13	Pure; single crystal; ϕ = 16°; 3 mm dia x 4 ~ 5 cm long; electrical resistivity reported as 37.4, 42.0, 86.6 and 125.6 μ ohm cm at -194.84, -183.20, -78.36 and 0 C, respectively.
77	475	L	1936	78,90		Bi 51	Pure; single crystal; ϕ = 86 [illegible] mm dia x 4 ~ 5 cm long; electrical resistivity reported as 37.0, 40.4 and 99.1 μ ohm cm at -194.78, -183.49 and 0 C, respectively.
78	475	L	1936	90.0		Bi 72	Pure; single crystal; ϕ = 85.5°; 3 mm dia x 4 ~ 5 cm long; electrical resistivity reported as 43.0 and 102.9 μ ohm cm at -183.13 and 0 C, respectively.
79	475	L	1936	91.8		Bi 66	Pure; single crystal; ϕ = 2°; 0.0898 cm^2 x 2.23 cm long.

SPECIFICATION TABLE NO. 5 *(continued)*

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
80	475	L	1936	92.2		Bi 66	The above specimen measured in a transverse magnetic field (H perpendicular to rod axis) with strength H=2520 oersteds and field orientation θ (the angle between field direction and a line perpendicular to the rod axis such that at θ = -12°, H is parallel to the x-axis and at θ = 78°, H is parallel to the y-axis; = -161°; x-axis parallel to one of the two-fold secondary axes; z-axis coincided with the trigonal axis.
81	475	L	1936	79.6		Bi 66	The above specimen measured without magnetic field.
82	475	L	1936	79.8		Bi 66	The above specimen measured at H=1500 oersteds and at θ = 108°.
83	475	L	1936	79.9		Bi 66	The above specimen measured at H=2520 oersteds and at θ = -41°.
84	475	L	1936	79.9		Bi 66	The above specimen measured at H=4850 oersteds and at mean θ (averaged from values which varied from 15-30°).
85	475	L	1936	79.9		Bi 66	The above specimen measured at H=6100 oersteds and at mean θ.
86	475	L	1936	91.0		Bi 13	Pure; single crystal; the angle *between trigonal* axis and rod axis ϕ = 16°; 0.1452 cm^2 x 3.10 cm long.
87	475	L	1936	91.2		Bi 13	The above specimen measured in a transverse magnetic field (H perpendicular to rod axis) with strength H=2460 oersteds and field orientation at θ = 4 and 38°, where θ is the angle between field direction and a line perpendicular to the rod axis such that at θ = 6°; H approx. parallel to x-axis.
88	475	L	1936	79,91		Bi 13	The above specimen measured at H=6100 oersteds and at mean θ (averaged from values which varied from 15-30°).
89	475	L	1936	78.5		Bi 13	The above specimen measured without magnetic field.
90	475	L	1936	78.7		Bi 13	The above specimen measured at H=2460 oersteds and at θ = -4 and 38°.
91	475	L	1936	78.7		Bi 13	The above specimen measured at H=6100 oersteds and at θ = 38°.
92	475	L	1936	79,91		Bi 51	Pure; single crystal; the angle between trigonal axis and rod axis ϕ = 86°; 0.0749 cm^2 x 2.18 cm long.
93	475	L	1936	91.1		Bi 51	The above specimen measured in a transverse magnetic field (H perpendicular to rod axis) with strength H=2520 oersteds and field orientation at θ = -152°; where θ is the angle between field direction and a line perpendicular to the rod axis such that at θ = 35°; H parallel to negative x-axis and at θ = -55°; H parallel to z-axis.
94	475	L	1936	91.4		Bi 51	The above specimen measured at H=4900 oersteds and at θ = -152°.
95	475	L	1936	79.3		Bi 51	The above specimen measured at H=2520 oersteds and at mean θ (averaged from values which varied from 15-30°).

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
96	475	L	1936	91.3		Bi 72	Pure; single crystal; the angle between trigonal axis and rod axis $\phi = 85.5°$; 0.0907 cm^2 x 2.51 cm long.
97	475	L	1936	91.3		Bi 72	The above specimen measured in a transverse magnetic field (H perpendicular to rod axis) with strength H=650 oersteds and field orientation at $\theta = 2°$, where θ is the angle between field direction and a line perpendicular to the rod axis such that at $\theta = 8°$, H is parallel to negative z-axis and at $\theta = 98°$, H is perpendicular to z-axis.
98	475	L	1936	91.3		Bi 72	The above specimen measured at H=650 oersteds and at $\theta = -124°$.
99	475	L	1936	91.2-91.4		Bi 72	The above specimen measured at H=1500 oersteds and at θ ranging from 2 to $-34°$.
100	475	L	1936	91.2		Bi 72	The above specimen measured at H=2520 oersteds and at $\theta = 2°$.
101	475	L	1936	91.3		Bi 72	The above specimen measured at H=2520 oersteds and at $\theta = -124°$.
102	475	L	1936	91.6		Bi 72	The above specimen measured at H=4900 oersteds and at $\theta = 2°$.
103	475	L	1936	91.6		Bi 72	The above specimen measured at H=4900 oersteds and at $\theta = -124°$.
104	475	L	1936	91.3-91.5		Bi 72	The above specimen measured at H=6100 oersteds and at θ ranging from 2 to $-34°$.
105	383		1956	320-500			Pure; electrical conductivity reported as 0.744, 0.684, 0.602, 0.544, 0.516, 0.509, 0.477, 0.446, 0.421 and 0.380 x 10^4 $ohm^{-1}cm^{-1}$ at 46.7, 69.1, 105.8, 134.6, 148.7, 152.1, 169.0, 188.8, 203.8 and 227.0 C, respectively.
106	460		1957	373.2			Pure.
107	470	L	1949	287.2			Pure; single crystal; bismuth plate, 2 x 9.3 x 9.3 mm; supplied by Merch; θ (the angle between the trigonal axis of the crystal and the direction of heat flow) = 0°.
108	470	L	1949	287.2			Similar to the above specimen except $\theta = 14.7°$.
109	470	L	1949	287.2			Similar to the above specimen except $\theta = 27.2°$.
110	470	L	1949	287.2			Similar to the above specimen except $\theta = 50.7°$.
111	470	L	1949	287.2			Similar to the above specimen except $\theta = 67.9°$.
112	470	L	1949	287.2			Similar to the above specimen except $\theta = 74.3°$.
113	470	L	1949	287.2			Similar to the above specimen except $\theta = 89.0°$.
114	577	L	1913	83-373			Pure; cylindrical specimen; made from bismuth supplied by C.A.F. Kahlbaum; bismuth powder pressed at 5000 kg cm^{-2} for 1 hour; density 1% less than cast bismuth; electrical conductivity reported as 3.5, 3.8, and 3.2 x 10^3 $ohm^{-1}cm^{-1}$ at -190, 0, and 100 C, respectively.
115	597, 708	L	1961	313-630	5		Measurements made on solid specimen and molten specimen (from same source as the solid specimen); 3 mm in diameter, 64 mm long used to determine data in liquid state; melting point 544.2 K.

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
116	592	L	1959	626-945			In liquid state; melting point 271°.
117	755	L	1962	100-300	~6		99.999 pure; single crystal; specimen 2 x 2 x 10 mm; provided by American Smelting and Refining Co.; as received; electrical resistivity 34.2, 42.4, 85.3 and 134.8 μohm cm at 79, 100, 200 and 300 K, respectively; heat flow parallel to trigonal axis.
118	755	L	1962	100-300	~6		Similar to the above specimen except electrical resistivity 32.5, 39.0, 73.1 and 111.7 μohm cm at 81, 100, 200 and 300 K, respectively; heat flow perpendicular to trigonal axis.
119	706	L	1881	273,373			Density 9.74 g cm^{-3}; electrical conductivity 0.929 and 0.630 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C respectively. (electrical conductivity reported as 0.929 and 0.63 x 10^5 ohm^{-1} cm^{-1}, probably a typographical error)
120	331	L	1964	1.46			Single crystal with rhombohedral structure; 16.8 x 4.55 x 2.0 mm, with trigonal axis parallel to the small dimension and bisectrix parallel to the large dimension; specimen taken from cylindrical ingot supplied by Texas Instruments Corporation; electrical resistivity reported as 1.1 and 1.2 μohm cm at 1.12 and 4.2 K, respectively; $\rho_{298.2}/\rho_{4.2}$ reported as 91.2; measured with the magnetic field directed along the trigonal axis, and the heat flow along the large dimension; magnetic field ranging from 1.02 to 17.98 kilogauss.
121	333	L	1929	300.2	±.50		Single crystal; disk specimen 25 mm in diameter and 2 mm thick; heat flow perpendicular to the trigonal axis; measured in magnetic fields (H) ranging from 2499 to 10554 gauss perpendicular to the trigonal axis.
122	333	L	1929	300.2	±.50		Similar to the above specimen except measured in magnetic fields parallel to the trigonal axis ranging from 0 to 10773 gauss.
123	333	L	1929	300.2	±.50		Single crystal; disk specimen 25 mm in dia and 2.0 mm thick; heat flow parallel to the trigonal axis; measured in magnetic fields perpendicular to the trigonal axis ranging from 0 to 11161 gauss.
124	333	L	1929	300.2	±.50		Similar to the above specimen except disk 2.02 mm thick and measured in magnetic fields ranging from 5071 to 9847 gauss.
125	333	L	1929	300.2	±.50		The above two specimens combined together (4.02 mm thick); measured in the same conditions as above with magnetic fields ranging from 4997 to 9973 gauss.
126	838	C	1967	453-770			The molten specimen placed in a hole 21 mm in dia drilled in an asbestos cement cylinder of 30 mm height; steel 1Kh18N9T used as comparative material.
127	120, 323	L	1934	110-209		1	Single crystal; specimen length 1.231 cm cross-section roughly triangular in shape with dimensions about 3 mm on a side; trigonal axis parallel to the length; supplied by Prof A. Goetz of CIT; measured in a vacuum of 10^{-6} mm Hg, and in a magnetic field of 7806 gauss parallel to one of the binary axes; heat flow along the trigonal axis.

SPECIFICATION TABLE NO. 5 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
128	120, 323	L	1934	117-190		1	The above specimen measured with the magnetic field perpendicular to one of the binary axes.
129	120, 323	L	1934	114-198		2	Single crystal; specimen length 1.3 cm. cross-section roughly triangular in shape with dimensions about 3 mm on a side; trigonal axis perpendicular to the length; measured in a vacuum of 10^{-6} mm Hg and in a magnetic field of 7800 gauss perpendicular to the trigonal axis; heat flow perpendicular to the trigonal axis.
130	120, 323	L	1934	108-216		2	The above specimen measured with the magnetic field parallel to the trigonal axis.
131	120, 323	L	1934	122-145		2	The above specimen measured with the magnetic field at 45° to the trigonal axis.
132	872	-	1967	1.3-1.9		Sample 3	99.9999 pure; single crystal; specimen 1.57 x 3.1 mm in cross-section; specimen axis along the bisectrix; electrical resistivity ratio $\rho(300)/\rho(4.2)$ - 140; thermal conductivity values calculated from heat capacity, velocity and effective mean free path.
133	872	-	1967	1.3-2.0		Sample 5	99.9999 pure; single crystal; specimen 3.8 x 3.85 mm in cross-section; specimen axis along the trigonal; electrical resistivity ratio $\rho(300)/\rho(4.2)$ - 104; thermal conductivity values calculated from heat capacity, velocity and effect mean free path.
134	1002	L	1967	80-301			Single crystal; 0.4 x 0.2 x 0.2 in.; electrical resistivity reported as 0.0349, 0.0472, 0.0680, 0.0854, 0.113, and 0.134 milliohm cm at 80, 112, 160, 198, 253, and 299 K, respectively; heat flow along the trigonal axis.
135	1002	L	1967	81-303			Single crystal; 0.4 x 0.2 x 0.2 in.; electrical resistivity reported as 0.0324, 0.0445, 0.0602, 0.0727 0.0950 and 0.116 milliohm cm at 77, 115, 156, 193, 249 and 298 K, respectively; heat flow along one of the binary axis.

REMARKS

The recommended values are for 99.997+% pure bismuth. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures above 10 K. The thermal conductivity near and below the corresponding temperature of its maximum is highly sensitive to small physical and chemical variations of the specimens, and the values below 10 K are intended as typical values for indicating the general trend.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu lb^{-1} ft^{-1} F^{-1}. ‡Values in parentheses are extrapolated.

REMARKS

The recommended values are for high-purity boron. The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures above 80 K. The thermal conductivity near and below the corresponding temperature of its maximum is highly sensitive to small physical and chemical variations of the specimens, and the values below 80 K are intended as typical values for indicating the general trend.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 7 THERMAL CONDUCTIVITY OF CADMIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 7]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	35	L	1912	83-273			Specimen 2-3 cm in dia; electrical conductivity 5.05, 1.835, and 1.289 x 10^5 $ohm^{-1}cm^{-1}$ at -190, -79, and 0 C, respectively.
2	77	E	1900	291,373			< 0.05 ~~each of Pb, Zn, and Fe~~ (Fe + Pb + Zn); density 8.63 g cm^{-3} at 16 C; electrical conductivity 13.13 and 9.89 x 10^4 $ohm^{-1}cm^{-1}$ at 18 and 100 C, respectively.
3	77	E	1900	291,373			Similar to the above specimen but drawn into a wire; electrical conductivity 13.25 and 10.18 x 10^4 $ohm^{-1}cm^{-1}$ at 18 and 100 C, respectively.
4	6	L	1931	327-540			Specimen prepared from "pure redistilled Cadmium"; density 8.64 g cm^{-3} at 21 C; same specimen as used by Lees (Curves 22 and 23).
5	97	L	1952	2.3-21	2-3	Cd 1	99.9999 pure; polycrystalline; cast in glass.
6	19	L	1923	318-708			Specimen 1.5 cm in dia and 12 cm long; melting point 320 C.
7	796	L	1881	273,373			Density 8.62 g cm^{-3}; electrical conductivity 14.41 and 10.18 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively. (The paper reported 14.41 and 10.18 x 10^5 $ohm^{-1}cm^{-1}$, obviously, a typographical error.)
8	122	L	1955	1.7-37	3	Cd 2	99.995 pure; single crystal; with heat flow at 79° to the hexagonal axis.
9	431	E	1944	414-526			Single crystal; electrical resistivity 10.08, 10.33, 10.90, 12.23, 13.20, and 14.10 µohm cm at 140.6, 146.9, 162.4, 202.0, 228.6, and 252.4 C, respectively.
10	431	E	1944	393-536			Polycrystal; electrical resistivity 11.84, 13.22, 14.34, 15.22, 16.65, 17.59, and 18.30 µohm cm at 119.6, 152.8, 177.2, 196.9, 228.2, 248.8, and 262.6 C, respectively.
11	383	E	1956	306-506			Pure; electrical conductivity at 12.89, 11.11, 9.51, 8.38, 7.60, and 7.32 x 10^4 $ohm^{-1}cm^{-1}$ at 32.5, 72.2, 122.2, 174.3, 207.5, and 232.6 C, respectively.
12	294	L	1932	21-297		Cd 53	Single crystal; specimen 0.1475 cm^2 in cross-sectional area and 6.70 cm long; angle between rod axis and hexagonal axis φ = 14°, electrical resistivity at 0.185, 2.001, 7.65, and 8.27 µohm cm at -252, -190, 0, and 20 C, respectively.
13	294	L	1932	22-295		Cd 47a	Single crystal; specimen 0.1009 cm^2 in cross-sectional area and 4.48 cm long; φ = 84°, electrical resistivity 0.1352, 1.63, 6.38, and 6.89 µohm cm at -252, -190, 0, and 20 C, respectively.
14	294	L	1932	21-297		Cd 47b	Similar to the above specimen except 0.0914 cm^2 in cross-sectional area and 6.65 cm long.
15	727	L	1960	0.10-0.60		Cd 1	Single crystal; heat flow along the hexagonal axis; includes superconducting state.
16	727	L	1960	0.10-0.75		Cd 3	Single crystal; heat flow perpendicular to the hexagonal axis; includes superconducting state.
17	230	L	1925	336.2			Impurities < 0.03; specimen in rod form 0.3 cm^2 in cross-sectional area and 5 to 6 cm long; electrical conductivity 13.76 x 10^4 $ohm^{-1}cm^{-1}$ at 23 C.
18	230	L	1925	326.2			Similar to the above specimen except 1.9 cm in dia and 10 cm long.
19	511	L	1918	296.9			Specimen 1.1 cm in dia; supplied by Erba; measured in atmospheric pressure.

SPECIFICATION TABLE NO. 7 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
20	619	L	1916	20-273			Purified; specimen ~ 0.5 cm in dia and 5 cm long; electrical conductivity 622.0, 52.5, and 14.5 x 10^4 $ohm^{-1}cm^{-1}$ at 20.4, 87.0, and 273 K, respectively.
21	619	L	1916	20-273			Chemically pure (Kahlbaum); specimen ~ 0.5 cm in dia and 5 cm long; electrical conductivity ~~62.00~~ 678.4, 53.58, and 14.6 x 10^4 $ohm^{-1}cm^{-1}$ at 20.4, 87.0, and 273 K, respectively.
22	88	L	1908	96-297			Turned from a cast stick of "Pure Redistilled Cadmium" as used in Cadmium-Cell; specimen 0.585 cm in dia and 7-8 cm long; density 8.64 g cm^{-3} at 21 C; electrical resistivity 2.22, 2.56, 4.18, 5.05, 5.46, 6.38, 6.96, and 7.78 μohm cm at -178.1, -165.9, -105.8, -75.1, -59.9, -25.2, -5.7, and 22.8 C, respectively; first experiment.
23	88	L	1908	105-295			The above specimen, second experiment.
24	727	L	1960	0.53		Cd 2	Single crystal; heat flow perpendicular to the hexagonal axis; at the transition point.
25	851	L	1960	82-276	10		99.95 pure; specimen 0.1877 in. dia x 2.255 in. long turned from cast stick obtained from A.D. Mackay; data corrected for rise in temperature during measurement.

700	0.490	28.3	800.3
800	(0.559)	(32.3)	980.3

REMARKS

The recommended values are for well-annealed 99.999+% pure cadmium with residual electrical resistivity ρ_0 = 0.000463, 0.000606, and 0.000502 $\mu\Omega$ cm, respectively, for single crystal along directions perpendicular and parallel to the c-axis and for polycrystalline cadmium (characterization by ρ_0 becomes important at temperatures below about 100 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.50, $\alpha' = 1.77 \times 10^{-4}$, and β = 0.0188 for the direction perpendicular to the c-axis; using n = 2.50, $\alpha' = 1.90 \times 10^{-4}$, and β = 0.0246 for the direction parallel to the c-axis; and using n = 2.50, $\alpha' = 1.80 \times 10^{-4}$, and β = 0.0204 for polycrystalline cadmium. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

REMARKS

The recommended values are for well-annealed 99.6 % pure cerium. The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures. Since the thermal conductivity at low temperature is highly sensitive to small physical and chemical variations of the specimens, the values below about 100 K would be higher for specimens of higher purity.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated or estimated.

SPECIFICATION TABLE NO. 9 THERMAL CONDUCTIVITY OF CESIUM

[For Data Reported in Figure and Table No. 9]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	92	L	1956	2.0-16		Cs 3	High purity; 1.6 mm in dia; melted in vacuo and run into soft-glass tube; run No. 1 yielded the following information: electrical resistivity ratio $\rho(295\ K)/\rho(0\ K)$ · 498 (using Hackspill's value ρ = 20.8 μohm cm at 295 K); $\rho(0\ K)$ = 0.0418 μohm cm; Lorenz function 2.51 x 10^{-8} V^2K^{-2} at 0 K.
2	92	L	1956	2.2-11		Cs 3	The above specimen second run; electrical resistivity ratio $\rho(295\ K)/\rho(0\ K)$ = 465 (using Hackspill's value ρ · 20.8 μohm cm at 295 K); $\rho(0\ K)$ - 0.0447 μohm cm; Lorenz function 2.47 x 10^{-8} V^2K^{-2} at 0 K.
3	655, 860	-	1964	349-1336			99.99 pure liquid specimen; thermal conductivity values calculated from electrical resistivity measurements using the theoretical Lorenz number; electrical resistivity reported as 20.29, 37.39, 42.57, 52.63, 63.59, 70.72, 83.92, 94.45, 112.48, 127.78, 153.48, 173.79, 211.94, and 241.12 μohm cm at 18.3, 28.3, 76.174, 267, 326, 427, 503, 614, 696, 811, 887, 993, and 1063 C, respectively.
4	756	-	1962	309-1050	10		Impurities (pretest): < 0.0010 O, < 0.0010 N, < 0.0045 C, < 0.0042 Rb, and traces of Si, Mg, Al, Cu, Na, Ca, and Fe; impurities (posttest): 0.0017 O, 0.0020 N, < 0.0020 C, < 0.0100 Rb, and traces of Si, Mg, Al, Cu, Na, Ca, and Fe; liquid specimen; supplied by MSA Research Corp.; thermal conductivity values calculated from electrical resistivity data using the theoretical Lorenz number 2.45 x 10^{-8} V^2K^{-2}; electrical resistivity reported as 37.42, 38.32, 45.77, 65.74, 77.28, 87.35, 123.63, 139.29, 161.26, and 178.63 μohm cm at 28.3, 35.8, 101.4, 276.9, 370.6, 444.2, 650.0, 725.8, 815.3, and 876.7 C, respectively.
5	863	-	1966	672.2			99.99 pure; vapor specimen filled in a test cell which is an 8-in. long (2.25 in.) schedule 40 pipe constructed from Hasteloy-C and is connected with a boiler; measured at a boiler pressure of 20 mm Hg; thermal conductivity measured by using the dynamic hot-wire method.
6	863	-	1966	739.2			Same as the above specimen except boiler pressure 40 mm Hg.
7	863	-	1966	738.2			Same as the above specimen except boiler pressure 62 mm Hg (saturated).
8	863	-	1966	839.2			Same as the above specimen except boiler pressure 65 mm Hg.
9	873, 874	-	1965	589-1913	1.3	Run 1	~ 99.97 Cs, 0.0154 O_2, 0.0145 Rb, 0.004 Na, 0.0023 Ca, 0.0018 Fe, 0.0016 B, 0.0013 Si, 0.0006 K, 0.0003 each of Mg, Ar and Ni; saturated liquid specimen filled in a test capsule (2 in. long, 1 in. OD and 1/16 in. in wall thickness with 1/4 in. thick discs welded to the ends of the tube made from Ta-10W alloy; specimen supplied by Dow Chemical Co.; thermal conductivity values calculated from electrical resistivity data using Lorenz number of 2.3 x 10^{-8} V^2K^{-2}; electrical resistivity reported as 69.42, 77.54, 86.23, 95.54, 105.4, 116.2, 127.4, 139.7, 152.5, 166.6, 181.7, 197.6, 216.9, 235.4, 257.0, 280.8, 306.7, 336.7, 370.1, 403.8, 451.0, 500.5, 557.9, 618.2, and 702.4 μohm cm at 316, 371, 427, 482, 538, 593, 649, 704, 760, 816, 871, 927, 982, 1038, 1093, 1149, 1204, 1260, [illegible]6, 1371, 1427, 1482, 1538, 1593, and 1649 C, respectively; critical temperature of Cs was estimated to be 2027 K.

SPECIFICATION TABLE NO. 9 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
10	873, 874	-	1965	589-1910	1.3	Run 2	Similar to the above; second loading of the test capsule.
11	873, 874	-	1965	589-1914	1.3	Run 3	Similar to the above; third loading of the test capsule.
12	875		1962	[illegible]45-1157			Vapor specimen.
13	287	C	1964	295-1556	5		99.994 pure (estimated from freezing point curve and emission spectrography for impurities); freezing point 28.52 C; specimen clad in Nb-1Zr alloy; specimen in liquid state except at 295.2 K where it was mostly solid; electrical resistivity reported as 44, 55, 67, 80, 96, 114, 134, 155, 179, 208, and 246 µohm cm at 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, and 1100 C, respectively; Nb-1Zr alloy used as comparative material.
14	997, 998	C	1967	350-950	±7-±14		0.05 Na, 0.033 Rb, and 0.0133 K; liquid specimen contained in a hollow cylinder of I.D. 14 mm; prepared from cesium chloride by reduction with calcium and subsequent distillation in a vacuum of 10^{-4}-10^{-5} mm Hg; Armco iron used as comparative material.
15	997, 998	C	1967	358-969	±7-±14		Similar to the above specimen.
16	997, 998	C	1967	428-904	±7-±14		Similar to the above specimen.
17	997, 998	C	1967	460-904	±7-±14		Similar to the above specimen.

REMARKS

The recommended values are for high-purity cesium with residual electrical resistivity $\rho_0 = 0.0465\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 60 K). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

---

*T_1 in K, k_1 in Watt cm^{-1}K^{-1}, T_2 in F, and k_2 in Btu hr^{-1}ft^{-1}F^{-1}.

‡Values in parentheses are extrapolated, interpolated, or estimated.

SPECIFICATION TABLE NO. 10 THERMAL CONDUCTIVITY OF CHROMIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 10]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	136	L	1940	196-334		Cr II	Electrolytic; specimen 0.7 x 0.23 x 0.21 cm; annealed at 1000 C for 30 min.
2	112	L, C	1957	323, 373			0.43 O; electrodeposited chromium tube, 1.28 cm O.D., 0.63 cm I.D., and 18.05 cm long; as deposited; density 6.975 g cm^{-3}; electrical resistivity 40.4, 41.7, 44.0, 45.4, 47.2, 48.9, and 50.3 μohm cm at -144, -112, -31, -44, -8, 32, 73 C, respectively.
3	112	L, C	1957	323-423			The above specimen heat treated at 486 K; electrical resistivity 30.3, 39.7, 42.2, 44.6, and 48.2 μohm cm at -172, 26, 95, 148, and 223 C, respectively.
4	112	L, C	1957	323-623			The above specimen heat treated at 478 K, density increased to 7.08 g cm^{-3}; electrical resistivity 6.2, 25.5, 28.9, 33.2, 35.2, 37.8, 39.9, and 47.2 μohm cm at -173, 21, 92, 174, 215, 265, 313, and 399 C, respectively.
5	112	L, C	1957	323-573			The above specimen heat treated at 818 K; electrical resistivity 4.4, 6.9, 10.5, 13.9, 18.1, 19.9, 25.5, 30.1, 37.2, 44.3, 48.8, and 52.2 μohm cm at -176, -140, -103, -58, -1, 31, 161, 220, 331, 434, 503, and 551 C, respectively.
6	112	L, C	1957	323-623			The above specimen heat treated at 1133 K; electrical resistivity 16.1, 21.7, 32.2, 46.0, and 65.7 μohm cm at 22, 162, 355, 570, and 869 C, respectively.
7	112	L, C	1957	323-673			The above specimen heat treated at 1327 K; electrical resistivity 14.3, 16.2, 19.9, 27.0, 30.4, 34.9, 40.5, 46.8, 53.3, 59.5, 71.8, and 77.4 μohm cm at 0, 62, 147, 293, 350, 435, 528, 636, 730, 816, 994, and 1067 C, respectively.
8	112	L, C	1957	323-1273			The above specimen heat treated at 1683 K; density increased to 7.15 g cm^{-3}; electrical resistivity 1.9, 10.5, 13.8, 17.2, 23.7, 30.2, 35.3, 44.7, 55.2, 65.4, 76.6, 81.6, and 95.2 μohm cm at -179, -46, 26, 120, 282, 406, 505, 669, 841, 999, 1167, 1236, and 1427 C, respectively.
9	68	L	1957	4.5-123		1	99.998 pure; specimen 3 mm in dia and 8 cm long; supplied by the Aeronautical Res. Labs. of the Commonwealth Dept. of Supply; cold worked; residual resistivity 0.255 μohm cm.
10	68	L	1957	5.1-91		2	The above specimen annealed at 1010 C for 4 hrs; residual resistivity 0.181 μohm cm.
11	68	L	1957	4.6-151		3	99.998 pure; partially recrystallized; specimen 3 mm in dia and 8 cm long; supplied by the Aeronautical Res. Labs of the Commonwealth Dept. of Supply; residual resistivity 0.125 μohm cm.
12	68	L	1957	2.9-142		4	The above specimen annealed at 1050 C for 4 hrs; residual resistivity 0.090 μohm cm.
13	68	L	1957	2.4-123		5	99.998 pure; fully recrystallized; specimen 3 mm in dia and 8 cm long; supplied by the Aeronautical Res. Labs of the Commonwealth Dept. of Supply; residual resistivity 0.055 μohm cm $\rho(273\ K)/\rho(0\ K) = 217$.
14	89	C	1956	470-1201			Chemically pure; ductile; supplied by the Bureau of Mines, Oregon; density 7.16 g cm^{-3} at 24 C.

REMARKS

The recommended values are for well-annealed 99.998⁺% pure chromium with residual electrical resistivity ρ_0 = 0.0609 μΩ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, α' = 1.04 x 10^{-4}, and β = 2.49. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 10% at other temperatures.

* T_1 in K, k_1 in Watt $cm^{-1}K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1}ft^{-1}F^{-1}$.

REMARKS

The recommended values are for well-annealed 99.999% pure cobalt with residual electrical resistivity $\rho_0 = 0.0905\ \mu\Omega$ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 Tm are calculated to fit the experimental data by using n = 2.10, $\alpha' = 0.747 \times 10^{-4}$, and $\beta = 3.71$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm⁻¹ K⁻¹, T_2 in F, and k_2 in Btu lb⁻¹ ft⁻¹ F⁻¹.

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	114	L	1950	23-245	0.6-1.8	OFHC Cu	Free from oxygen; high conductivity; specimen 0.5 in. in dia and 20 in. long; obtained from American Brass Co.
2	154	L	1956	2.9-70	5	1	0.20 Ni; 0.10 O; 0.05 each of As, Sb, Fe, Pb, and Sn, 0.01 S, 0.003 Bi (composition according to All-Union standard); annealed to 800 C.
3	154	L	1956	2.4-108	5	2	Similar to the above specimen except unannealed.
4	135	L	1935	293,473			99.986 pure; 0.022 O, 0.0016 Fe, 0.0015 S; annealed at 550 C for 1 hr.
5	124	P	1930	368-766		1	Electrolytically pure; specimen ~0.25 cm in dia; annealed for about 10 min at a bright red heat; electrical conductivity 4.47, 3.14, 2.07 and 1.99 x 10^5 ohm^{-1} cm^{-1} at 95, 235, 466 and 497 C, respectively; density 8.87 g cm^{-3}.
6	124	P	1930	302-744		2	Electrolytically pure; specimen ~0.25 cm in dia; annealed for about 10 min at a bright red heat; electrical conductivity 5.55, 4.0, 2.84 and 2.06 x 10^5 ohm^{-1} cm^{-1} at 29, 136, 286 and 471 C, respectively, density 8.87 g cm^{-3}.
7	90	L	1957	1456,1550			0.036 O, 0.02 Ag, 0.002 Al, 0.002 Fe, 0.001 Ni, 0.001 Mg, 0.001 Si, 0.0005 Ca, traces of H and N; electrolytic tough-pitch copper; in molten state.
8	109	L	1957	5.1-142	2-5	Coalesced Copper	High-purity commercial coalesced copper; 0.0013 O, 0.0008 Pb, 0.0007 Ni, < 0.0005 each of Fe, As, and Sb, 0.0002 Sn, < 0.0001 Te, and Ag, < 0.00005 Bi; specimen 0.367 cm in dia and 23.2 cm long; annealed in helium 4 hrs at 400 C, cooled slowly to 200 C, and then kept in helium at 200 C for 8 hrs; density 8.90 g cm^{-3}.
9	152	L	1949	10-20			Electrical copper; specimen 0.47 mm in dia and 900 mm long; annealed.
10	108	E	1958	315-1058	3		Commercial electrolytic copper.
11	84	P	1918	349-636			Specimen drawn wire 2.5 mm in dia.
12	95	E	1915	21-374		Cu I	Electrolytically pure; specimen 1 mm in dia; supplied by Siemens and Halske Co.
13	95	E	1915	22-375		Cu II	Electrolytically pure but purity lower than the above specimen.
14	52	L	1952	339-533	5	A	Oxygen-free (< 0.01 O) high-conductivity copper.
15	77	E	1900	291,373		Cu II	< 0.05 (Fe+Zn); specimen 1.108 cm in dia and 27 cm long; density 8.65 g cm^{-3} at 18 C.
16	77	E	1900	291,373		Cu IIW	< 0.05 (Fe+Zn); specimen 1.107 cm in dia and 27 cm long.
17	77	E	1900	29',373		Cu III	0.05 Pb, traces of Ni and Fe; specimen 1.107 cm in dia and 27 cm long; drawn; density 8.88 g cm^{-3} at 18 C.
18	130	P	1951	309-834			Specimen 0.125 in. in dia and at least 50 cm long.
19	41	C	1956	1362-1761	± 2		Electrolytic tough pitch copper; before measurement: 0.012 O_2, 0.0048 N_2, and trace Al, Ca, Mg, Ni, Si and Ti; after measurement: 0.0059 O_2, 0.0055 N_2 and all the metallic impurities reduced about ten fold; density 8.83 g cm^{-3}; in molten state.

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used*	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
20	80	L	1928	95-293			Single crystal; specimen 0.6 cm in dia and 12 cm long; supplied by General Electric Co.
21	57	L	1927	21, 83		Cu 2b	Very high purity; porous natural crystal from Lake Superior, hammered from 3 mm to 1.3 mm and then annealed 3 hrs at 380 C; electrical resistivity 1.562, 0.235 and 0.00187 μohm cm at 273, 83 and 21 K, respectively.
22	57	L	1927	21, 83		Cu 3	"Purest" electrolytic copper; fine grains; electrical resistivity 1.552, 0.239 and 0.00424 μohm cm at 273, 83 and 21 K, respectively.
23	57	L	1927	21, 83		Cu 4a	"Purest" electrolytic copper; with fine grains; annealed 4.5 hrs at 380 C; electrical resistivity 1.56, 0.240, 0.00406 μohm cm at 273, 83 and 21 K, respectively.
24	57	L	1927	21, 83		Cu 6a	Not very pure; single crystal; annealed 7.5 hrs at 380 C; electrical resistivity 1.58, 0.249, 0.01356 μohm cm at 273, 83 and 21 K, respectively.
25	18	L	1936	15-20			Specimen 0.2 mm in dia.
26	58	L	1934	22, 79		Cu 2b	Very high purity; probably somewhat deformed.
27	127	L	1925	369-898			99.9 pure; supplied by Bolton and Sons, Ltd., Oakmoor; density 8.92 g cm^{-3} at 21 C; electrical resistivity 1.69, 2.60, 3.73, 4.88, and 6.03 μohm cm at 14.0, 144.8, 306.0, 470.0, and 630.2 C, respectively.
28	97, 122	L	1952	2.5-41	2-3	Cu 1	99.999 pure; polycrystalline; JM 4234 from Johnson, Matthey and Co.; 3.02 mm dia and 2.99 cm long; annealed for several hrs in vacuo at 800 C; ρ(293 K)/ρ(20 K) = 85.3.
29	23	E	1894	347-440			Electrolytic copper; specimen a prismatic bar with 5 cm x 2 cm cross section.
30	103	L	1953	0.29-4.2			Polycrystalline; commercial grade high purity magnet wire; specimen 0.025 cm in dia and 27.2 cm long; supplied by General Electric Co.
31	88	L	1908	107-299			Turned from soft-drawn high-conductivity copper conductor; specimen 0.585 cm in dia and 7-8 cm long; electrical resistivity 0.375, 0.543, 0.637, 0.939, 0.989, 1.365, 1.506, and 1.750 μohm cm at -176.8, -151.2, -136.9, -102.0, -91.1, -36.0, -15.5, and 16.9 C, respectively; density 8.84 g cm^{-3} at 23 C.
32	89	C	1956	367-1144			99.9+ pure; electrolytic tough pitch copper; density 8.92 g cm^{-3} at 24 C.
33	11	L	1952	2.6-91			99.999 pure, about 0.0005 Ag, < 0.0003 Ni, < 0.0004 Pb; JM 4234 from Johnson, Matthey and Co.; drawn and annealed in a helium atmosphere at 450 C for 6 hrs; electrical resistivity for the range 12-15 K given as $\rho = 5.27 \times 10^{-3} + 2.64 \times 10^{-10} T^5$ (μohm cm).
34	2	L	1948	1.8-4.1	2		0.003 Ag, 0.003 Ni, 0.003 Pb; approximate composition; free from oxygen; Johnson Matthey and Co. Ltd. No. 1562; annealed in air; $\rho_0 = 0.055$ μΩ cm.
35	145	L	1953	2.0-160	1, but up to 4 between 5 and 15 K	Cu 1	99.999 pure; JM 4272 from Johnson, Matthey and Co.; about 0.0005 Ag, 0.0004 Pb, and < 0.0003 Ni, and barely visible spectral lines of Ga and Fe; specimen 2 mm in dia rod; as drawn; electrical resistivity for the range 10 to 35 K given as $\rho = 0.0576 \times 10^{-6} + 3.7 \times 10^{-16} T^5$ (ohm cm).

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
36	145	L	1953	2.5-155	4	Cu2	The above specimen annealed in vacuo at 550 C for 3 hrs.
37	116	F	1895	219-260			Electrolytic copper.
38	186	P	1928	305.2			Electrolytically pure; specimen 2.5 mm in dia and 4.69 cm long; electrical conductivity 5.58×10^5 mho cm^{-1} at 32 C; density 8.93 g cm^{-3} at 32 C.
39	224	L	1923	423.2			99.98 pure; annealed.
40	224	L	1923	428.2			99.98 pure; cast.
41	224	L	1923	423.2			99.97 pure; hard-drawn.
42	224	L	1923	430.2			99.76 pure; cast.
43	270	P	1915	308,333			specimen 0.25 cm in dia and 30 cm long; density 8.93 g cm^{-3} at room temperature (from Tabellen of Landolt and Bornstein).
44	271	L	1938	273-403	0.11		≤ 0.079 O.
45	271	L	1938	273-403	0.11		≤ 0.079 O, 0.106 Ni.
46	271	L	1938	273-403	0.11		≤ 0.022 O.
47	271	L	1938	273-403	0.11		≤ 0.022 O, 0.106 Ni.
48	52	L	1952	339-533	5	B	0.015 Fe, 0.011 P; cast.
49	52	L	1952	339-533	5	C	0.061 Fe, 0.016 P; cast.
50	52	L	1952	339-533	5	D	0.089 Fe, 0.015 P; cast.
51	341	L	1954	1.9-130			0.056 Fe; nominal composition; homogenized and annealed; residual electrical resistivity (at helium temp) 0.56 μ ohm cm.
52	341	L	1954	1.9-142			0.0043 Fe; nominal composition; homogenized and annealed; residual electrical resistivity (at helium temp) 0.041 μ ohm cm.
53	225	L	1926	373.2			Electrolytic.
54	145	L	1953	5.0-58	< 4	Cu 3	99.999 pure; JM 4272 from Johnson, Matthey and Co.; about 0.0005 Ag, 0.0004 Pb, < 0.0003 Ni, and barely visible spectral lines of Ga and Fe; specimen 1 mm in dia rod; as drawn.
55	427	L	1960	303.2	1-3	ETP	Electrolytic tough pitch copper; specimen 0.75 in. in dia and 9 in. long.
56	404	L	1950	2.5-4.6	4		99.998+ pure; polycrystal; supplied by Johnson, Matthey and Co.
57	428	R	1957	1673-2500	± 10		In liquid state.
58	246	T	1919	273,373			Rolled, drawn, and then heated 0.5 hr at temp close to melting point.
59	429	R	1937	285.7	± 0.7		Pure.

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
60	430	T	1924	273.2			Pure; rolled and drawn to wire of 1 mm^2 cross section and 3 cm long, and heated at temp close to melting point.
61	431	E	1944	597-1245			Polycrystal.
62	432	L	1957	5.0-40		Coalesced Cu	99.98 pure; 0.0013 O_2, 0.0007 Ni, 0.0008 Pb, 0.0002 Sn, each of Fe, As, Sb < 0.0005, 0.0001 Te, and Bi < 0.00005; cold rolled, annealed for 1 hr at 650 C, redrawn and reannealed for 17 min at 760 C, followed by grinding to sample size of 0.144 in. in dia; density 8.899 g cm^{-3}; porosity 0.5%.
63	432	L	1957	4.0-40		Electrolytic tough pitch	0.01 Fe, 0.001 each Ag and Zn, each of Al, Cr, Pb, Mg, Mn, and Sn < 0.0001; electrolytic tough pitch; density 8.914 g cm^{-3}; ground.
64	432	L	1957	5.0-100		Phosphorus deoxidized Cu	0.027 P, 0.01 each of Fe, Ag, and Zn, 0.001 each Ni and Si, < 0.0001 each of Al, Cr, Pb, Mg, and Mn; density 8.917 g cm^{-3}; ground.
65	433	L	1940	78.2		Electrolytic Cu	0.015 Sb, 0.010 Fe, 0.007 S, trace Pb.
66	434	L	1959	4.0-105			99.999 pure; swaged from about 0.375 in. down to about 0.072 in., cleaned with a 1:1 solution of HCL and a 1:10 solution of HNO_3, annealed in vacuum for 2 hrs at 400 C, drawn through tungsten carbide dies to 0.070 in., cleaned with acids, and finally annealed again in vacuum for 2 hrs at 400 C; slight unavoidable work hardening of the sample during installation in the apparatus.
67	434	L	1959	4.0-105			99.999 pure; swaged from about 0.375 in. down to about 0.0816 in., cleaned with acids, annealed in vacuum for 2 hrs at 400 C, and then drawn through tungsten carbide dies to 0.070 in. in which the cross-section area reduced by 26.4%; not annealed again after drawing.
68	435	L	1900	291.2			Pure.
69	435	L	1900	291.2			Trace As.
70	410	R	1935	273.2	1		Pure; electrical conductivity 62.8 x 10^4 mho cm^{-1} at 273.2 K.
71	436	L	1938	21.17		Cu 12	Natural single crystal; tempered for 3 hrs at 380 C; measured at H (the transverse magnetic field strength) = 0 and θ (the angle between magnetic field direction and a line perpendicular to rod axis) = 0° at which the electrical resistivity is nearly minimum and H nearly parallel to [100] direction.
72	436	L	1938	21.17		Cu 12	The above specimen measured at H = 2280 oersteds and θ = 0°.
73	436	L	1938	21.18		Cu 12	The above specimen measured at H = 4490 oersteds and θ = 0°.
74	436	L	1938	21.21		Cu 12	The above specimen measured at H = 8750 oersteds and θ = 0°.
75	436	L	1938	21.23		Cu 12	The above specimen measured at H = 10880 oersteds and θ = 0°.
76	436	L	1938	21.25		Cu 12	The above specimen measured at H = 12200 oersteds and θ = 0°.

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
77	436	L	1938	21.17		Cu 12	The above specimen measured at H = 0 oersteds and θ = -40° at which the electrical resistivity is nearly maximum and H nearly parallel to [110] direction.
78	436	L	1938	21.18		Cu 12	The above specimen measured at H = 2280 oersteds and θ = -40°.
79	436	L	1938	21.19		Cu 12	The above specimen measured at H = 4490 oersteds and θ = -40°.
80	436	L	1938	21.24		Cu 12	The above specimen measured at H = 8750 oersteds and θ = -40°.
81	436	L	1938	21.24		Cu 12	The above specimen measured at H = 10800 oersteds and θ = -40°.
82	436	L	1938	21.30		Cu 12	The above specimen measured at H = 12200 oersteds and θ = -40°.
83	437	E	1902	291.2			Pure.
84	390	P	1956	354.2			Pure.
85	438	E	1914	21-373			Electrolytic copper wire; not annealed and not bent, but heated considerably during soldering.
86	135	L	1935	293,473		Bar 104	99.80 Cu, 0.19 Si, and 0.02 Fe; specimen 0.75 in. in dia and 8 in. long; electrical conductivity 29.58 and 21.30 x 10^4 mho cm^{-1} at 20 and 200 C, respectively; annealed at 700 C for 2 hrs.
87	439	L	1935	323-848	2		99.9 pure.
88	355	L	1955	1.5-142	1		99.98 pure; 0.02 Ge; specimen 1 ~ 2 mm in dia and 6 cm long; drawn; and annealed; electrical resistivity 1.92 μ ohm cm at 295 K.
89	619	L	1916	20-273			High purity single crystal natural copper.
90	619	L	1916	22-273			Commercially pure; fine crystalline.
91	440	L, R	1940	78,273		Electrolytic Cu	Impurities: 0.015 Sb, 0.010 Fe, 0.007 S, 0.0003 As; annealed in nitrogen stream for 20 hrs at 380-400 C; electrical conductivity 6.22 and 43.1 x 10^5 mho cm^{-1} at 273 and 78 K, respectively.
92	134	L	1931	337-477	< 2	93	99.94 pure; 0.042 P, 0.04 Fe; annealed at 650 C for 1 hr and cooled in air.
93	134	L	1931	337-494	< 2	82	99.97 pure; 0.075 P, 0.04 Fe; annealed at 650 C for 1 hr and cooled in air.
94	134	L	1931	325-496	< 2	95	99.74 pure; 0.18 P; annealed at 650 C for 1 hr and cooled in air.
95	67	L	1932	438			99.917 pure; 0.083 P; specimen 0.5 in. in dia and 6.5 in. long; annealed.
96	67	L	1932	438			99.865 pure; 0.135 P; specimen 0.5 in. in dia and 6.5 in. long; annealed.
97	67	L	1932	438			99.93 pure; 0.07 As; specimen 0.5 in. in dia and 6.5 in. long; annealed.
98	67	L	1932	438			99.856 pure; 0.144 As; specimen 0.5 in. in dia and 6.5 in. long; annealed.
99	230	L	1925	332.2			Impurity < 0.03; electrical conductivity 50.8 x 10^4 mho cm^{-1} at 296.2 K.

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
100	135	L	1935	293, 473		Bar 114	0.07 Mn, 0.01 Fe, 0.02 Mg; specimen 0.75 in. in dia and 8 in. long; electrical conductivity 52.55 and 32.18 x 10^4 mho cm^{-1} at 20 and 200 C, respectively; annealed at 700 C for 2 hrs.
101	135	L	1935	293, 473		Bar 115	0.14 Mn, 0.01 Fe, 0.01 Mg; specimen 0.75 in. in dia and 8 in. long; electrical conductivity 45.79 and 29.4 x 10^4 mho cm^{-1} at 20 and 200 C, respectively; annealed at 700 C for 2 hrs.
102	40	L	1956	764-1287	5	Electrolytic tough pitch	Electrolytic tough pitch copper meeting Federal Specification QQC 576 (minimum 99.9 Cu); density 8.83 g cm^{-3}; specimen 7 in. in dia and 1.5 in. thick.
103	562	L	1949	23-245		OFHC	Oxygen-free high conducting (OFHC) copper.
104	496	C	1940	80, 273	< 1		Pure.
105	504	P	1961	295.2	± 5	OFHC	specimen 1.9 cm^2 in cross-sectional area and 0.312 cm thick.
106	622	P	1960	363.2			Commercial grade; 99.82 pure; density 8.3 g cm^{-3}.
107	622	P	1960	363.2			The above specimen, second run.
108	622	P	1960	363.2			The above specimen, third run.
109	622	P	1960	363.2			The above specimen, fourth run.
110	579	L	1936	15-20			"Very pure".
111	135	L	1935	293, 473		Bar No. 99	0.07 Al and 0.01 Fe; annealed at 750 C for 2 hrs; electrical conductivity 52.58 and 31.69 x 10^4 mho cm^{-1} at 20 and 200 C, respectively.
112	620		1956	320-773	< 3		99.99 pure; polycrystalline; electrical resistivity 1.92, 2.50, 3.17, 3.81, 4.43 and 5.03 μ ohm cm at 46.9, 134.5, 232.2, 323.3, 411.1 and 499.3 C, respectively.
113	57	L	1927	21, 83		Cu 4	"Purest" electrolyte; with fine grains.
114	57	L	1927	21, 83		Cu 4b	The above specimen hammered, then annealed for 4.5 hrs at 380 C, and recrystallized at 950 C for 5 min.
115	57	L	1927	21, 83		Cu 6	Not very pure; single crystal; sawed from larger block and lathed into rod.
116	57	L	1927	21, 83		Cu 6b	From the same block as the above specimen Cu6; hammered from 6 mm to 2.5 mm dia and annealed for 3 hrs at 380 C.
117	57	L	1927	21, 83		Cu 6c	Similar to the above specimen Cu6b except further annealed in vacuum for 5 min at 950 C; about 25 grain cross-sections per 1 mm^2.
118	57	L	1927	21, 83		Cu 7	Lathed from the same block as specimen 6; 3 to 4 crystal grains on the measuring length; unannealed.
119	57	L	1927	21, 83		Cu 7a	Similar to the above specimen Cu7 except annealed for 4 hrs at 380 C.

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
120	623	L	1960	2.0-55			99.999 pure copper from the Central Research Lab. of the American Smelting and Refining Co.; less than 0.0001 each of Fe, Sb, Se, and less than 0.0002 each of Te and As; 0.030 in. dia wire, rolled and drawn from a 0.75 in. dia rod then annealed at 530 C in vacuo for some hrs; residual electrical resistivity 0.865 ± 0.01 x 10^{-8} ohm cm.
121	57	L	1927	21,83		Cu 2a	Very high purity; porous natural crystal hammered from 3 mm to 1.3 mm dia.
122	57	L	1927	21,83		Cu 9	Not very pure; single crystal solidified from melt; completely undeformed and unworked.
123	‡	P	1968	298.2		No. 1	Disk specimen 1.25 cm in diameter and 0.042 cm thick; obtained from DuPont Detaclad stock; thermal conductivity value calculated from the measurement of thermal diffusivity with density value taken from Lyman, T. (editor, "Metals Handbook", 8th ed., Vol. 1, 1961) and specific heat capacity value taken from Kelley, K.K. (U.S. Bureau of Mines Bulletin 584, 1960).
124	683		1963	0.50-0.88		Cu 1	Commercial, polycrystalline wire.
125	683		1963	0.42-0.93		Cu 2	99.999 pure, polycrystalline wire.
126	683		1963	0.42-0.94		Cu 3	99.999 pure, polycrystalline wire; annealed at 898.2 K for 3 hrs.
127	706	L	1881	273,373			Density 8.82 g cm^{-3}; electrical conductivity 45.74 and 33.82 x 10^4 $ohm^{-1} cm^{-1}$ (the author reported 45.74 and 33.82 x 10^5, probably a typographical error) at 0 and 100 C, respectively.
128	880	L	1965	0.4-1.5	± 1		Specimen a foil of 0.05 mm thickness, supplied by Chase Brass and Copper Co.; annealed at 530 C for three hrs; residual resistance ratio 270.
129	851	L	1960	80~217	10		Commercial copper; specimen 0.375 in. in dia and 2.975 in. long; cylinder with a part of 1.1 in. long at one end turned down to a dia of 0.125 in.; data corrected for drift rate.
130	851	L	1960	199~275	10		Similar to the above specimen.
131	843	-	1966	298.2			Nearly spherical grains supplied by Belmont Smelting and Refining Co.; mesh size -30 + 35; specimen contained in a 0.75 in. dia and 2 in. long cylindrical cell; thermal conductivity measured by using the transient line source method, the heat source was a 36-gauge constantan wire contained in a 0.025 in. O.D. hypodermic tube soldered along the axis of the cylindrical cell, data calculated from measured line temperatures at two certain times; measured in Freon-12 under a pressure of ~100 psig.
132	843	-	1966	298.2			Similar to the above specimen; measured in argon under a pressure of ~100 psig.
133	843	-	1966	298.2			Similar to the above specimen; measured in nitrogen under a pressure of ~100 psig.
134	843	-	1966	298.2			Similar to the above specimen; measured in methane under a pressure of ~100 psig.
135	843	-	1966	298.2			Similar to the above specimen; measured in helium under a pressure of ~100 psig.

‡ Larson, K.B. and Koyama, K., J. Appl. Phys., 39 (9), 4408-16, 1968.

SPECIFICATION TABLE NO. 12 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
136	843	-	1966	298.2			Similar to the above specimen; measured in hydrogen under a pressure of ~100 psig.
137	1005	E	1927	273.2			Specimen No. 10 gauge commercial wire 10 cm in length electrical resistivity 1.73 μ ohm cm at 0 C.
138	1005	E	1927	273.2			The above specimen measured in a longitudinal magnetic field of 10000 gausses.

DATA TABLE NO. 12 THERMAL CONDUCTIVITY OF COPPER

(Impurity < 0.20% each; total impurities < 0.50%)

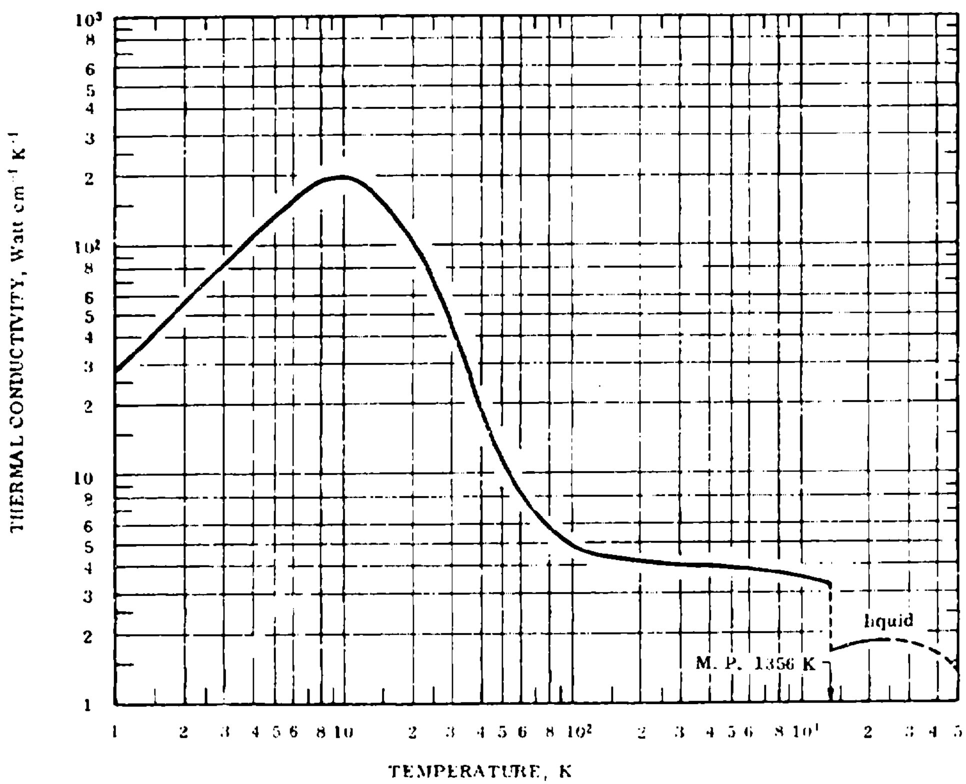
FIGURE AND TABLE NO. 12R RECOMMENDED THERMAL CONDUCTIVITY OF COPPER



REMARKS

The recommended values are for well-annealed 99.999$^+$% pure copper with residual electrical resistivity ρ_0 = 0.000851 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.40, a = 0.19, m = 2.59, α'' = 4.16 x 10^{-6}, and β = 0.0348. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 5% at other temperatures.

REMARKS

The recommended values are for well-annealed 99.93% pure dysprosium with residual electrical resistivity ρ_0 = 4.7 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu lb^{-1} ft^{-1} F^{-1}. ‡Values in parentheses are estimated.

SPECIFICATION TABLE NO. 14 THERMAL CONDUCTIVITY OF ERBIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 14]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	322, 808	L	1965	2-99			99.9 pure; polycrystalline; 3 x 0.2 x 0.025 cm; annealed at 650 C for 2 hr in vacuum of 10^{-4} mm Hg; electrical resistivity 8.44 μohm cm; electrical resistivity ratio ρ(298 K)/ρ(4.2 K) = 10.2; T. P. (ferromagnetic - antiferromagnetic) 20 K; Neel temperature 80 K; data taken from smoothed curve.
2	777	C	1965	291.2	3		High purity; polycrystalline; 0.25 in. dia. 0.25 in. thick; supplied by Johnson Matthey and Co. Ltd.; electrical resistivity 79 μohm cm at 18 C; measurements made using 2 different thermal comparators; Monel used as comparative material.
3	809	L	1965	6.5-310			0.01 Ca, 0.02 Ho, 0.005 Mg, 0.07 O, 0.01 Si, and trace Tm; polycrystalline; 0.476 cm dia, 6 cm long; supplied by Research Chemicals; arc-melted, machined, swaged, and annealed in vacuum (~10^{-5} torr) at 800 K for 50 hrs; T. P. (ferromagnetic - antiferromagnetic) 19 K; Néel temperature 86 K; data above 75 K extracted from smooth curve; electrical resistivity 3.79 μohm cm at 4.16 K; measured in vacuum.
4	809	L	1965	6.5-33			The second run of the above specimen; measured during cooling.
5	811		1954	301.2	10		No information given.
6	‡	L	1968	6.9-300	6		0.0500 Ta, 0.0235 O, 0.0260 Mg, < 0.0200 Ca, 0.0150 Cr, 0.0150 Fe, < 0.0100 Dy, < 0.0100 Ho, < 0.0050 Si, < 0.0050 Y, 0.0017 H, 0.0011 N, < 0.0010 Tm, < 0.0010 Yb, and traces of Cu and W; single crystal; 5.81 x 1.88 x 1.86 mm; grown from arc-melted buttons using the strain anneal method; < 10$\bar{1}$0 > direction (b-axis) along the specimen axis; electrical resistivity ratio ρ(300 K)/ρ(4.2 K) = 17.4; Lorenz function reported as 4.42, 3.91, 3.71, 3.99, 4.52, 4.90, 5.17, 5.24, 5.08, 4.73, 4.42, 3.94, and 3.75 x $10^{-8}V^2K^{-2}$ at 6.4, 10.3, 15.9, 22.0, 31.3, 43.8, 65.1, 80.0, 101.8, 126.4, 179.2, 260.1, and 299.9 K, respectively; heat flow along the b-axis.

REMARKS

The recommended values are for well-annealed 99.89⁺% pure erbium with residual electrical resistivity ρ_0 = 3.79 μohm cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or estimated.

REMARKS:

The recommended values are for well-annealed high-purity gadolinium with residual electrical resistivity ρ_0 = 2.41 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

[a] T_1 in K, k_1 in Watt cm⁻¹ K⁻¹, T_2 in F, and k_2 in Btu lb⁻¹ ft⁻¹ F⁻¹. [‡] Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 17 THERMAL CONDUCTIVITY OF GALLIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 17]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	342	L	1953	[illegible].4, 4.6		Ga 42-1	Single crystal; 2.92 cm long, 0.223 cm dia; supplied by National Physical Lab; rod axis parallel to the high electrical resistance direction of the crystal; measured in a longitudinal field of 0.36 KOe (kiloorsted).
2	342	L	1953	[illegible].6		Ga 42-1	The above specimen measured in a longitudinal field of 0.73 KOe.
3	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a longitudinal field of 1.08 KOe.
4	342	L	1953	4.6		Ga 42-1	The above specimen measured in a longitudinal field of 1.47 KOe.
5	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a longitudinal field of 1.81 KOe.
6	342	L	1953	[illegible]		Ga 42-1	The above specimen measured in a longitudinal field of 2.15 KOe.
7	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a longitudinal field of 2.51 KOe.
8	342	L	1953	4.6		Ga 42-1	The above specimen measured in a longitudinal field of 2.98 KOe.
9	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a longitudinal field of 3.24 KOe.
10	342	L	1953	3.4		Ga 42-1	The above specimen measured in a longitudinal field of 3.62 KOe.
11	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a longitudinal field of 3.65 KOe.
12	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a transverse field of 0.36 KOe.
13	342	L	1953	4.6		Ga 42-1	The above specimen measured in a transverse field of 0.73 KOe.
14	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a transverse field of 1.10 KOe.
15	342	L	1953	4.6		Ga 42-1	The above specimen measured in a transverse field of 1.42 KOe.
16	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a transverse field of 1.78 KOe.
17	342	L	1953	4.6		Ga 42-1	The above specimen measured in a transverse field of 2.17 KOe.
18	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a transverse field of 2.53 KOe.
19	342	L	1953	4.6		Ga 42-1	The above specimen measured in a transverse field of 2.90 KOe.
20	342	L	1953	2.3-4.6		Ga 42-1	The above specimen measured in a transverse field of 3.26 KOe.
21	342	L	1953	2.3		Ga 42-1	The above specimen measured in a transverse field of 3.54 KOe.
22	342	L	1953	4.6		Ga 42-1	The above specimen measured in a transverse field of 3.62 KOe.
23	342	L	1953	3.4		Ga 42-1	The above specimen measured in a transverse field of 3.66 KOe.
24	342	L	1953	4.6		Ga 42-1	The above specimen measured in a transverse field of 3.88 KOe.
25	342	L	1953	2.5, 4.4		Ga 42-2	Single crystal; 2.45 cm long, 0.218 cm dia; supplied by National Physical Lab; rod axis parallel to the low electrical resistance direction; measured in a transverse field of 0.35 KOe.

SPECIFICATION TABLE NO. 17 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
26	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a longitudinal field of 0.35 KOe.
27	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a transverse field of 1.05 KOe.
28	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a longitudinal field of 1.05 KOe.
29	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a transverse field of 1.80 KOe.
30	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a longitudinal field of 1.80 KOe.
31	342	L	1953	4.4		Ga 42-2	The above specimen measured in a transverse field of 2.55 KOe.
32	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a longitudinal field of 2.55 KOe.
33	342	L	1953	4.4		Ga 42-2	The above specimen measured in a transverse field of 3.24 KOe.
34	342	L	1953	2.5, 4.4		Ga 42-2	The above specimen measured in a longitudinal field of 3.24 KOe.
35	342	L	1953	2.5		Ga 42-2	The above specimen measured in a longitudinal field of 3.76 KOe.
36	342	L	1953	4.4		Ga 42-2	The above specimen measured in a longitudinal field of 3.91 KOe.
37	342	L	1953	4.4		Ga 42-2	The above specimen measured in a transverse field of 3.98 KOe.
38	342	L	1953	4.4		Ga 42-3	Single crystal; supplied by National Physical Lab; rod axis parallel to the intermediate electrical resistance direction; measured in a transverse field of 0.2 KOe.
39	342	L	1953	2.3, 4.4		Ga 42-3	The above specimen measured in a transverse field of 0.38 KOe.
40	342	L	1953	2.3-4.4		Ga 42-3	The above specimen measured in a longitudinal field of 0.38 KOe.
41	342	L	1953	4.4		Ga 42-3	The above specimen measured in a transverse field of 0.75 KOe.
42	342	L	1953	2.3, 3.3		Ga 42-3	The above specimen measured in a transverse field of 1.17 KOe.
43	342	L	1953	2.3-4.4		Ga 42-3	The above specimen measured in a longitudinal field of 1.17 KOe.
44	342	L	1953	4.4		Ga 42-3	The above specimen measured in a transverse field of 1.43 KOe.
45	342	L	1953	2.3, 3.3		Ga 42-3	The above specimen measured in a transverse field of 1.80 KOe.
46	342	L	1953	2.3, 4.4		Ga 42-3	The above specimen measured in a longitudinal field of 1.80 KOe.
47	342	L	1953	4.4		Ga 42-3	The above specimen measured in a transverse field of 2.16 KOe.
48	342	L	1953	2.3, 3.3		Ga 42-3	The above specimen measured in a transverse field of 2.53 KOe.
49	342	L	1953	2.3-4.4		Ga 42-3	The above specimen measured in a longitudinal field of 2.53 KOe.
50	342	L	1953	4.4		Ga 42-3	The above specimen measured in a transverse field of 2.90 KOe.
51	342	L	1953	2.3, 3.3		Ga 42-3	The above specimen measured in a transverse field of 3.22 KOe.
52	342	L	1953	2.3, 4.4		Ga 42-3	The above specimen measured in a longitudinal field of 3.22 KOe.

SPECIFICATION TABLE NO. 17 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
53	342	L	1953	4.4		Ga 42-3	The above specimen measured in a transverse field of 3.60 KOe.
54	342	L	1953	2.3, 3.3		Ga 42-3	The above specimen measured in a transverse field of 3.72 KOe.
55	342	L	1953	2.3		Ga 42-3	The above specimen measured in a longitudinal field of 3.7 [illegible]
56	342	L	1953	4.4		Ga 42-3	The above specimen measured in a longitudinal field of 3.84 KOe.
57	342	L	1953	3.3		Ga 42-3	The above specimen measured in a longitudinal field of 3.86 KOe.
58	342	L	1953	4.4		Ga 42-3	The above specimen measured in a transverse field of 4.09 KOe.
59	122	L	1955	1.8-38		Ga 42-1	Single crystal; 2.92 cm long, 0.223 cm in dia; supplied by National Physical Lab; rod axis parallel to the high electrical resistance direction of the crystal; electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 92.11.
60	122	L	1955	2.7-40		Ga 42-2	Single crystal; 2.45 cm long, 0.218 cm in dia; supplied by National Physical Lab; rod axis parallel to the low electrical resistance direction of the crystal; electrical resistivity ratio $\rho_{(293K)}/\rho_{(20K)}$ 111.
61	122	L	1955	2.3-29		Ga 42-3	Single crystal; supplied by National Physical Lab; rod axis parallel to the intermediate electrical resistance direction of the crystal; electrical resistivity ratio $\rho_{(293K)}/\rho_{(20K)}$ 106.5.
62	608	L	1960	0.16-1.3	10	3 Da	0.1 impurities (mainly Si, P, K, Ca, Al, Ti, and V); single crystalline rod; 3 mm dia; rod axis parallel to the crystallographic a-direction (a = 4.5258 Å); electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 1.28 x 10^2; in superconducting state.
63	608	L	1960	0.12-1.3	10	3 Db	0.1 impurities (mainly Si, P, K, Ca, Al, Ti, and V); single crystalline rod; rod axis parallel to the crystallographic b-direction (b = 4.5198 Å); electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 1.18 x 10^2; in superconducting state.
64	608	L	1960	0.12-1.4	10	3 Dc	0.1 impurities (mainly Si, P, K, Ca, Al, Ti, and V); single crystalline rod; rod axis parallel to the crystallographic c-direction (c = 7.6602 Å); electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 0.67 x 10^2; in superconducting state.
65	608	L	1960	0.13-4.6	10	2 Pa	0.001 impurities (mainly Si, P, Ca, Al, Ti, and V); single crystalline rod; rod axis parallel to the crystallographic a-direction (a = 4.5258 Å); electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 2.08 x 10^4; in normal and superconducting state.
66	608	L	1960	0.12-4.0	10	2 Pb	0.001 impurities (mainly Si, P, Ca, Al, Ti, and V); single crystalline rod; rod axis parallel to the crystallographic b-direction (b = 4.5198 Å); electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 2.33 x 10^4; in normal and superconducting state.
67	608	L	1960	0.13-4.2	10	2 Pc	0.001 impurities (mainly Si, P, Ca, Al, Ti, and V); single crystalline rod; rod axis parallel to the crystallographic c-direction (c = 7.6602 Å); electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 1.35 x 10^4; in normal and superconducting state.
68	608	L	1960	0.16-0.75	10	b-3P	0.001 impurities (mainly Si, P, Ca, Al, Ti, and V); single crystalline rod, rod axis parallel to the crystallographic b-direction (b = 4.5198 Å); specimen 1.7 mm in dia; electrical resistivity ratio $\rho_{(293K)}/\rho_{(0K)}$ 2.44 x 10^3; in superconducting state.

SPECIFICATION TABLE NO. 17 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
69	608	L	1960	0.15-0.85	10	c-4P	0.001 impurities (mainly Si, P, Ca, Al, Ti and V); single crystalline rod; rod axis parallel to the crystallographic c-direction (C = 7.6602 Å); dia 0.7 mm; electrical resistivity ratio $\rho(293\ K)/\rho_0 = 10^4$, in superconducting state.
70	597	L	1961	283-621	5		99.999 pure; measured in solid state and liquid state; 3 mm dia, 64 mm long; melting point 30 C.
71	757	C	1957	333			99.95 pure liquid gallium; supplied by Aluminum Company of America; mercury of 0.0001 impurity used as comparative material.
72	682	L	1960	0.2-0.7		c-6	0.0077 impurity; single crystalline; specimen 0.12 cm dia, approx 50 cm long; heated above the critical temperature after each measuring cycle and brought back into the superconducting state in a magnetic field compensated to approx 0.2 oersted; electrical resistivity ratio $\rho(293\ K)/\rho_0 = 1.85 \times 10^3$.
73	682	L	1960	0.5-1.0		c-7	Similar to the above specimen except 0.0023 impurity; 0.083 cm dia; $\rho(293\ K)/\rho_0 = 6.25 \times 10^3$.
74	682	L	1960	0.1-0.8		c-8	Similar to the above specimen except 0.0017 impurity; 0.16 cm dia; $\rho(293\ K)/\rho_0 = 8.33 \times 10^3$.
75	682	L	1960	0.1-0.9		c-9	Similar to the above specimen except 0.00086 impurity; 0.115 cm dia; $\rho(293\ K)/\rho_0 = 1.67 \times 10^4$.
76	682	L	1960	0.1-0.7		c-10	Similar to the above specimen except 0.0005 impurity; 0.11 cm dia; $\rho(293\ K)/\rho_0 = 2.78 \times 10^4$.
77	758	L	1963	83-293		Ga 14·2	Single crystalline rod; approx 4 mm in dia; supplied by National Chemical Laboratory; electrical resistivity reported as 12.0, 20.3, 30.8, 40.6, 50.3, and 54.3 μohm cm at 83, 123, 173, 223, 273, and 293 K, respectively; electrical resistivity ratio $\rho(293\ K)/\rho(20.4\ K) = 136$; heat flow parallel to the c-axis.
78	758	L	1963	83-293		Ga 14·5	Similar to the above specimen except electrical resistivity reported as 3.52, 6.18, 9.42, 12.7, 16.05, and 17.40 μohm cm at 83, 123, 173, 223, 273, and 293 K, respectively; electrical resistivity ratio $\rho(293\ K)/\rho(20.4\ K) = 159$; heat flow parallel to the a-axis.
79	758	L	1963	83-293		Ga 14·4	Similar to the above specimen except electrical resistivity reported as 1.72, 2.92, 4.44, 5.96, 7.48, and 8.10 μohm cm at 83, 123, 173, 223, 273, 293 K, respectively; electrical resistivity ratio $\rho(293\ K)/\rho(20.4\ K) = 155$; heat flow parallel to the b-axis.
80	759	L	1954	1.7-20		a_1	Impurities: 0.01 Hg, 0.001 Ca, 0.001 Fe, 0.001 Si, 0.0001-0.001 Pb, 0.0001 Mg, and 0.00001 Cu; single crystal; Ga supplied by Aluminum Company of America; electrical resistivity $\rho(273\ K) = 16.1$ μohm cm; electrical resistivity ratio $\rho(273\ K)/\rho(14\ K) = 588$; heat flow parallel to a-axis.
81	759	L	1954	2.2-20		c_1	Impurities: 0.01 Hg, 0.001 Ca, 0.001 Fe, 0.0001-0.001 Cu, 0.0001 Mg, and trace of Pb; $\rho(273\ K) = 52.0$ μohm cm; $\rho(273\ K)/\rho(14\ K) = 455$; heat flow parallel to c-axis.

SPECIFICATION TABLE NO. 17 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
82	759	L	1954	1.8-16		b_3	Impurities: 0.01 Hg, 0.001 Ca, 0.001 Fe, 0.0001-0.001 Cu, 0.0001 Mg, and trace of Pb; single crystal; Ga supplied by Aluminum Company of America; ρ(273 K) = 7.6 μohm cm; ρ(273 K)/ρ(14 K) = 625; heat flow parallel to b-axis.
83	759	L	1954	1.9-20		a_2	Impurities: 0.05-0.5 Hg, 0.001 Ca, 0.001 Fe, 0.001 Si, 0.0003-0.003 Pb, 0.0001-0.001 Cu, and 0.0001 Mg; single crystal; Ga supplied by Aluminum Company of America; ρ(273 K) = 19.8 μohm cm; ρ(273 K)/ρ(14 K) = 455; heat flow parallel to b-axis.
84	759	L	1954	2.0-20		b_7	Impurities: 0.01-0.1 Hg, 0.001 Ca, 0.001 Fe, 0.0001-0.001 Cu, 0.0001-0.001 Pb, and 0.0001 Mg; ρ(273 K) = 7.5 μohm cm; ρ(273 K)/ρ(14 K) = 476; heat flow parallel to b-axis.
85	759	L	1954	1.8-20		c_7	Impurities: 0.02-0.2 Hg, 0.001 Ca, 0.001 Fe, 0.0001-0.001 Cu, 0.0001 Mg, and trace of Pb, ρ(273 K) = 52.8 μohm cm; ρ(273 K) ρ(14 K) = 370 heat flow parallel to c-axis.
86	838	C	1966	278-473			The molten metal placed in a hole 21 mm in dia drilled in an asbestos cement cylinder of 30 mm height; steel 1Kh18N9T used as comparative material.

600	0.586	33.9	620.3

REMARKS

The recommended values are for 99.9999% pure gallium with residual electrical resistivity ρ_0 = 0.000100, 0.0000341, and 0.000424 $\mu\Omega$ cm along directions parallel to a-, b-, and c-axis, respectively (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, α' = 3.28 x 10^{-4}, and β = 0.00409 for the direction parallel to a-axis; using n = 2.00, α' = 1.26 x 10^{-4}, and β = 0.00140 for the direction parallel to b-axis; and using n = 2.00, α' = 11.2 x 10^{-4}, and β = 0.0174 for the direction parallel to c-axis. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 15% at other temperatures.

*T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$. ‡Values in parentheses are interpolated.

**The values recommended for gallium single crystal in the direction parallel to the a-axis are also approximately good for polycrystalline gallium.

SPECIFICATION TABLE NO. 18 THERMAL CONDUCTIVITY OF GERMANIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 18]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	264	C	1952	298-373	10		High-purity; n-type single crystal; 0.313 x 0.313 x 0.75 in.; heat flow parallel to [100] crystalline axis; Ni and Zn used as comparative materials.
2	267	C	1955	278-365			High-purity; n-type single crystal; supplied by Westinghouse Research Laboratories; heat flow parallel to the [100] crystal direction; cast Zn and cast Ni used as comparative materials.
3	155	L	1951	2.7-79	20		High-purity; single crystal; 0.25 in. in dia and ~1.5 in. long; prepared by melting in a graphite crucible, solidified slowly by lowering the crucible through the furnace at a rate of 3 in. hr^{-1}; electrical resistivity 0.30 ohm cm at room temperature.
4	155	L	1951	2.7-86	< 20		0.0022 Al; single crystal; 0.125 in. in dia and ~1.5 in. long; same preparation method as above; electrical resistivity 0.0021 ohm cm at room temperature.
5	274	L	1954	2.2-95		Ge 1	High-purity; single crystal; 1 cm long and 1.2 x 0.6 mm cross section; electrical resistivity at room temperature 60 ohm cm.
6	343	L	1956	2.8-137		Ge 3a	High-purity; p-type; polycrystalline.
7	343	L	1956	1.9-111		Ge 3b	The above specimen cleaned, annealed at 550 C for 3 hrs in helium, then cooled slowly.
8	344	L	1959	330-962		1	n-type single crystal; 0.4 cm^2 in cross sectional area and 0.3 cm long; electrical resistivity 3 ohm cm at 293 K.
9	344	L	1959	319-962		2	Similar to the above specimen except electrical resistivity 0.05 ohm cm at 293 K.
10	344	L	1959	331-1094		3	Similar to the above specimen except 0.8 cm long and electrical resistivity 0.03 ohm cm at 293 K.
11	344	L	1959	324-1040		4	Similar to the above specimen except 0.3 cm long and electrical resistivity 0.001 ohm cm at 293 K.
12	345	L	1957	87-293	3-8	1	Sb-doped; n-type single crystal; 2.035 x 0.231 x 0.417 cm; electrical resistivity 2.84 ohm cm at room temperature.
13	345	L	1957	91-307	3-8	2	Sb-doped; n-type single crystal; 1.800 x 0.228 x 0.294 cm; electrical resistivity 6×10^{-3} ohm cm at room temperature.
14	345	L	1957	88-300	3-8	8	Sb-doped; p-type single crystal; thermally converted from the above specimen 2; 1.675 x 0.212 x 0.250 cm; electrical resistivity 1.6 ohm cm at room temperature.
15	345	L	1957	89-311	3-8	3	Sb-doped; n-type single crystal; dimensions 1.875 x 0.262 x 0.329 cm; electrical resistivity 40 ohm cm at room temperature.
16	345	L	1957	94-311	3-8	4	Ga-doped; p-type single crystal; dimensions 2.000 x 0.336 x 0.285 cm; electrical resistivity 68 ohm cm at room temperature.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
17	345	L	1957	96-305	3-8	5	Ga-doped p-type single crystal; dimensions 1.450 x 0.215 x 0.330 cm; electrical resistivity 51 ohm cm at room temperature.
18	345	L	1957	208-260	3-8	6	Ga-doped p-type single crystal; dimensions 2.205 x 0.295 x 0.503 cm; electrical resistivity 5 ohm cm at room temperature.
19	345	L	1957	90-306	3-8	7	Ga-doped p-type single crystal; 2.13 cm long, 0.062 cm^2 cross sectional area; electrical resistivity 3 x 10^{-3} ohm cm at room temperature.
20	346	L	1959	388-971			Single crystal; intrinsic; 18 mm dia x 20 mm long.
21	346	L	1959	405-971			p-type;single crystal; 18 mm in dia x 20 mm long; impurity concentration 1.1 x 10^{18} cm^{-3}.
22	247		1958	76-370			p-type;single crystal; crystallographic orientation [111]; heat treated at 500 C for 32 hrs.
23	348	C	1959	368-758			n-type; single crystal; oriented in the [100] direction; 30 mils dia x 100 mils long; measured in He atmosphere; Ni used as comparative material(data from Honda, Simidv, 1917).
24	348	C	1959	354-1000			Similar to the above specimen but oriented in the [110] direction.
25	348	C	1959	370-775			Similar to the above specimen.
26	349	L	1958	293	4		Single crystal; impurity concentration 1.4 x 10^{15} cm^{-3}; approx 15 mm long and 16 mm in dia.
27	349	L	1958	293	4		Ga-doped p-type single crystal; impurity concentration 7.4 x 10^{17} atom cm^{-3}; approx 15 mm long and 16 mm in dia.
28	349	L	1958	293	4		Fe-doped n-type single crystal; impurity concentration 4.1 x 10^{17} atom cm^{-3}; approx 15 mm long and 16 mm in dia.
29	349	L	1958	293	4		Ga-doped p-type single crystal; impurity concentration 4.1 x 10^{16} atom cm^{-3}; approx 15 mm long and 16 mm in dia.
30	349	L	1958	293	4		Fe-doped n-type single crystal; impurity concentration 2.2 x 10^{16} atom cm^{-3}; approx 15 mm long and 16 mm in dia.
31	349	L	1958	293	4		Ga-doped p-type single crystal; impurity concentration 8.8 x 10^{16} atom cm^{-3}; approx 15 mm long and 16 mm in dia.
32	349	L	1958	293	4		Fe-doped n-type single crystal; impurity concentration 7.5 x 10^{16} atom cm^{-3}; approx 15 mm long and 16 mm in dia.
33	350	L	1953	56-91		A18-4-1	Al-doped p-type single crystal; cut transverse to the axis of crystal growth; electrical resistivity 0.2 ohm cm at room temperature.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
34	350	L	1953	65-81		Sb-7	Sb-doped n-type single crystal; specimen parallel to the [110] direction; cut transverse to the axis of crystal growth; electrical resistivity 0.013 ohm cm at room temperature.
35	351		1954	283	5-8		Pure crystal.
36	352	L	1957	2.0-100		Ga-2	Ga-doped p-type single crystal; 3.2 x 3.6 x 25 mm; cut transverse to the crystal growth axis; electrical resistivity 6.9 and 7.84 milliohm cm at 10 K and room temperature, respectively.
37	352	L	1957	2.0-100		Ga-2	The above specimen irradiated in Argonne CP-5 reactor with fast neutrons (total flux 5 x 10[16] neutrons cm^{-2}) then kept at room temperature for about 5 months; electrical resistivity 6.4 and 7.657 milliohm cm at room temperature, respectively.
38	353	L	1958	1.5-120		PN-3E	Ga-Sb-doped p-type single crystal; data derived from the measurement of three specimens.
39	354	L	1957	2.2-280		Ge 2	n-type single crystal; carrier concentration 10^{13} cm^{-3}; specimen cross section 2.53 x 2.68 mm; zone grown; electrical resistivity at room temperature approx 39 ohm cm; heat flow parallel to the [100] direction.
40	354	L	1957	2.1-31		Ge 3	In-doped p-type single crystal; carrier concentration 10^{11} cm^{-3}; specimen cross section 2.56 x 2.65 mm; grown by zone melting; electrical resistivity 37 ohm cm at room temperature; heat flow parallel to [111] direction.
41	354	L	1957	2.9-84		Ge 4	In-doped p-type single crystal; carrier concentration 1.9 x 10^{14} cm^{-3}; specimen cross section 2.65 x 2.66 mm; grown by zone melting; electrical resistivity ~21 ohm cm at room temperature; heat flow parallel to [111] direction.
42	354	L	1957	2.2-78		Ge 5	n-type single crystal; carrier concentration 10^{12} cm^{-3}; specimen cross section 2.19 x 2.10 mm; pulled from melt, cut parallel to crystal growth direction; electrical resistivity approx 41 ohm cm at room temperature; heat flow parallel to [100] direction.
43	354	L	1957	2.0-97		Ge 7	In-doped p-type single crystal; carrier concentration 2.3 x 10^{16} cm^{-3} cross section 2.70 x 2.69 mm; grown by zone melting; electrical resistivity approx 0.19 ohm cm at room temperature; heat flow parallel to the [111] direction.
44	354	L	1957	2.2-80		Ge 10	In-doped p-type single crystal; carrier concentration 10^{15} cm^{-3}; specimen cross section 2.56 x 2.60 mm; grown by zone melting; electrical resistivity approx 2.75 ohm cm at room temperature; heat flow parallel to the [111] direction.
45	354	L	1957	2.0-100		Ge 11	Ga-doped p-type single crystal; carrier concentration 2 x 10^{18} cm^{-3}; specimen cross section 2.13 x 1.86 mm; pulled from melt, cut parallel to crystal growth direction; electrical resistivity approx 0.009 ohm cm at room temperature; heat flow parallel to the [100] direction.

SPECIFICATION TABLE NO. 14 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
46	354	L	1957	2.2-96		Ge 12	Ga-doped p-type single crystal; carrier concentration 10^{17} cm^{-3}; specimen cross section 2.06 x 1.95 mm; pulled from melt, cut parallel to crystal growth direction; electrical resistivity approx 0.0027 ohm cm at room temperature; heat flow parallel to the ⟨100⟩ direction.
47	355	L	1955	3.3-155	1-5	Ge 1	n-type single crystal; specimen 2 x 4 mm cross section, 5 mm long; electrical resistivity 31 ohm cm at 22 C.
48	779	L	1958	3.0-25		Normal Ge	n-type single crystal.
49	779	L	1958	2.1-290		Enriched Ge^{74}	Specimen composed of the following isotopes: 95.78 Ge^{74}, 0.728 Ge^{70}, 1.10 Ge^{72}, 1.54 Ge^{73} and 0.840 Ge^{76}; supplied by Union Carbide Nuclear Co.; 1.2 x 10^{13} excess donor atoms cm^{-3}; 2.54 cm long, 0.13 x 0.157 cm cross section; zone refined, grown using a modified Teal Little crystal puller; heat flow parallel to the ⟨100⟩ direction.
50	578	C	1960	311-683			n-type; electrical resistivity approx 5 ohm cm (inhomogeneous, electrical resistivity, especially high at center); F.H. stainless steel used as the reference (data on F.H. stainless steel from R.W. Powell 1936).
51	263	L	1958	300		T-1097	Sb-doped n-type; polycrystalline; specimen dimensions 5 x 5 x 15 mm; electrical resistivity 10.0 ohm cm at 300 K; measured in a vacuum of approx 10^{-6} mm Hg.
52	780, 684	L	1960	3.2-300	±5		Cu-doped p-type single crystal; (approx 10^{14} atoms cm^{-3}); dimensions 0.94 x 0.94 x 3.2 cm; dislocation density 3 x 10^{3} cm^{-2}.
53	780	R	1960	300-1020	±5		Very pure; n-type polycrystalline; crystal size approx 0.2 cm; specimen 1.27 cm in dia 6.1 cm long; zone refined, ground and cut to desired size; electrical resistivity 30 ohm cm at 300 K; average crystallite size 0.2 cm.
54	781, 684	R	1963	398-1194	±5		Intrinsic Ge; carrier concentration 2 x 10^{12} cm^{-3}; doped by copper during measurement to give 5 x 10^{15} acceptors cm^{-3}; cylindrical specimen approx 2.6 cm dia x 13 cm long made from single crystal grown by Czochralskii's method from zone refined germanium of the G.E. Co.; specimen aligned in the [100] crystalline direction; electrical resistivity before thermal conductivity measurement 46.6 ohm cm at room temperature changed to 4.6 ohm cm after the measurement.
55	626	P	1960	308-1073	±2		As-doped n-type single crystal; 2 in. long, cross section 0.3 x 0.3 in., heat flow and rod axis parallel to ⟨111⟩ direction; electrical resistivity at room temp. 0.3 ohm cm; thermal conductivity values calculated from measured thermal diffusivity data and the specific heat value of 1.83 J $cm^{-3}K^{-1}$ (derived from Dulong-Petit' law).
56	782		1957	16			Very pure; single crystal; 14.80 mm^{2} cross section; polished.
57	783	L	1960	112-429		Sample 1	p-type; crystal obtained by Czochralskii method; cross sectional area, 0.53 x 0.32 cm^{2}; sand blasted; electrical resistivity ρ at room temperature 60 ohm cm; data corrected for radiation.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
58	783	L	1960	83-455		Sample 1A	Similar to the above specimen except cross sectional area 0.45 x 0.25 cm^2, produced from specimen 1 by grinding away a side.
59	783	L	1960	108-460		Sample 2	Similar to the above specimen except cross sectional area 0.74 x 0.55 cm^2, ρ = 21 ohm cm at room temperature.
60	783	L	1960	109-461		Sample 3	n-type; crystal obtained by Czochralskii method; cross sectional area 0.39 x 0.63 cm^2; sand blasted ρ ~ 2 ohm cm at room temperature.
61	783	L	1960	106-451		Sample 4	Ga-doped p-type; obtained from zone melting; cross sectional area 0.72 x 0.87 cm^2. ρ = 0.049 ohm cm at room temperature.
62	783	L	1960	107-460		Sample 5	Sb-doped n-type; obtained from zone melting; cross sectional area 0.82 x 0.53 cm^2. ρ = 0.043 ohm cm at room temperature.
63	784	L	1962	1.2-98	6	Sb 30	Sb-doped single crystal; 12.217 x 3.211 x 1.5055 mm; from ingot grown by the Czochralskii technique with the growth axis in [110] direction; cut transversely to the ingot axis, ground to size with specimen axi[illegible] ap[illegible] [100] direction; carrier concentration n [illegible] 2.5 x 10^8 cm^{-3}; electrical r[illegible] reported as 2.691, 2.70, 2.67, 2.65, 2.6, 2.846, 2.855, 2.87[illegible], 2.904, 2.919, 3.319, 3.386, 3.413, 3.441, 3.443, and 3.524 m[illegible] 1.234, 1.664, 2.004, 2.658, 4.128, 14.00, 14.78, 16.11, 17.98, 1[illegible], 20.22, 55.60, 68.44, 74.14, 84.33, 90.46, and 296 K, respectively.
64	784	L	1962	1.3-87	6	Sb 172	Sb-doped single crystal; 15.918 x 3.8221 x 3.7129 mm; same fabrication method as above; specimen axis approx in [111] direction; n = 6.1 x 10^{15} cm^{-3}; electrical resistivity reported as 2.15 x 10^6, 3.20 x 10^4, 3.22 x 10^3, 5.66 x 10^2, 63.22, 21.46, 4.311, 2.277, 2.058, 1.608, 1.115, 0.9610, 0.6570, 0.5448, 0.4587, 0.3685, 0.3099, 0.2309, 0.1557, 0.1075, 0.09557, 0.09040, 0.09343, 0.09512, 0.09708, 0.09931, 0.1052, 0.1252, 0.1812, 0.248, and 0.3988 ohm cm at 4.214, 5.139, 5.947, 6.763, 8.422, 9.690, 12.54, 14.22, 14.64, 15.45, 17.03, 17.82, 20.22, 21.76, 23.39, 26.02, 28.65, 34.06, 39.98, 47.13, 52.74, 62.13, 77.22, 81.32, 82.93, 97.20, 120.2, 166.6, 211.1, and 297.5 K, respectively.
65	784	L	1962	1.3-145	6	Sb 187	Sb-doped single crystal; 16.422 x 3.8906 x 4.0601 mm; same fabrication method as above; specimen axis approx in [100] direction; n = 1.2 x 10^{17} cm^{-3}; electrical resistivity reported as 182.4, 178.3, 172.8, 168.7, 163.6, 158.8, 155.8, 154.2, 152.8, 153.3, 154.1, 155.2, 151.0, 141.8, 132.4, 113.5, 98.69, 87.6, 79.16, 68.39, 55.54, 43.86, 37.13, 31.25, 24.55, 23.36, 22.51, 20.32, 18.81, 18.51, and 24.4 milliohm cm at 1.314, 1.436, 1.639, 1.835, 2.157, 2.582, 3.042, 3.451, 4.209, 5.981, 6.587, 8.208, 12.16, 14.12, 16.84, 20.23, 23.39, 25.71, 28.32, 31.46, 37.49, 45.16, 51.71, 60.13, 77.24, 82.12, 86.62, 102.6, 126.2, 141.5, and 296.9 K, respectively.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
66	794	L	1962	1.2-98	6	Sb 207	Sb-doped single crystal; 14.73 x 3.8975 x 3.9068 mm; same fabrication method and specimen axis orientation as above; n = 2.4 x 10^{16} cm^{-3}; electrical resistivity reported as 7.72 x 10^5, 1.63 x 10^5, 7.15 x 10^4, 3.40 x 10^4, 9.072 x 10^3, 1.371 x 10^3, 451, 179.2, 35.9, 12.49, 2.847, 1.331, 0.7778, 0.4815, 0.3191, 0.2570, 0.2143, 0.1702, 0.1400, 0.1049, 0.07895, 0.06426, 0.05369, 0.04743, 0.04187, 0.04091, 0.04066, 0.04180, 0.04372, 0.04692, and 0.09460 ohm cm at 2.140, 2.594, 3.016, 3.467, 4.214, 5.222, 5.935, 6.609, 8.194, 9.563, 12.21, 14.04, 15.84, 17.91, 20.21, 21.78, 23.28, 25.48, 27.72, 32.01, 38.06, 44.33, 52.17, 60.21, 77.36, 84.40, 99.69, 115.1, 128.9, 146.1, and 296.4 K, respectively.
67	794	L	1962	1.5-137	6	Sb 222	Sb-doped single crystal; 18.128 x 4.0751 x 4.0667 mm; same fabrication method and specimen axis orientation as above; n = 1.1 x 10^{18} cm^{-3}; electrical resistivity reported as 4.364, 4.372, 4.385, 4.404, 4.418, 4.430, 4.447, 4.466, 4.496, 4.523, 4.585, 4.642, 4.728, 4.786, 4.849, 4.891, 4.936, 5.020, 5.141, 5.268, 5.373, 5.453, 5.517, 5.479, 5.436, 5.375, 5.262, 5.075, 4.940, and 4.951 milliohm cm at 1.320, 1.579, 1.925, 2.587, 3.032, 3.422, 4.667, 5.624, 6.971, 8.256, 10.87, 13.14, 15.90, 17.97, 20.20, 21.75, 23.34, 26.15, 30.76, 36.27, 42.04, 48.21, 58.31, 77.28, 83.58, 92.17, 105.7, 125.9, 149.7, and 299.8 K, respectively.
68	794	L	1962	1.4-137	6	As 223 I	As-doped single crystal; 16.682 x 4.0939 x 4.0645 mm; same fabrication method and specimen axis orientation as above; n = 2.1 x 10^{16} cm^{-3}; electrical resistivity reported as 7.8 x 10^6, 2.7 x 10^6, 1.99 x 10^3, 343.1, 28.38, 6.263, 3.467, 1.367, 0.8056, 0.4880, 0.3521, 0.2527, 0.2079, 0.1640, 0.1160, 0.0943, 0.07229, 0.06290, 0.05490, 0.04620, 0.04479, 0.04337, 0.04363, 0.04550, 0.04893, and 0.09447 ohm cm at 4.208, 5.059, 7.378, 8.443, 10.77, 12.95, 13.96, 15.71, 18.04, 20.20, 21.59, 23.25, 25.93, 28.34, 32.92, 36.80, 43.40, 48.46, 55.44, 71.09, 77.17, 91.16, 104.7, 122.3, 142.0, and 293.9 K, respectively.
69	794	L	1962	1.5-125	6	As 223 II	As-doped single crystal; 15.938 x 3.8903 x 4.0645 mm; same fabrication method and specimen axis orientation as above; n = 8.3 x 10^{16} cm^{-3}; electrical resistivity 0.04178 ohm cm at room temperature.
70	794	L	1962	1.4-134	6	As 226	As-doped single crystal; 17.482 x 4.0612 x 3.8648 mm; same fabrication method and specimen axis orientation as above; n = 8.8 x 10^{17} cm^{-3}; electrical resistivity reported as 8.570, 8.577, 8.584, 8.592, 8.617, 8.642, 8.691, 8.800, 8.798, 8.774, 8.760, 8.582, 8.625, 8.749, 8.943, 9.120, 9.394, 9.606, 9.730, 9.872, 9.885, 9.730, 9.252, 9.014, 8.675, 8.228, 7.907, 7.590, and 6.568 milliohm cm at 1.346, 1.564, 1.751, 1.946, 2.584, 3.020, 3.507, 4.191, 4.927, 5.394, 5.855, 7.016, 7.996, 10.68, 14.32, 17.81, 23.29, 28.20, 32.11, 38.92, 49.48, 59.49, 77.15, 85.36, 95.98, 111.2, 123.5, 138.4, and 295.5 K, respectively.

72	798	L	1962	1.3-129	[illegible]	As 233 I	As-doped single crystal; 17.308 x 4.0731 x 3.9978 mm; same fabrication method and specimen axis orientation as above; n = 1.1 x 10^{17} cm^{-3}; electrical resistivity reported as 1.92 x 10^6, 4.60 x 10^5, 1.69 x 10^5, 7.08 x 10^4, 2.238 x 10^4, 2.222 x 10^4, 2.189 x 10^4, 3408, 315.6, 104.2, 44.19, 16.65, 5.344, 2.647, 1.246, 0.7792, 0.4994, 0.3371, 0.2784, 0.2309, 0.1823, 0.1472, 0.1213, 0.08625, 0.06402, 0.05244, 0.04378, 0.03024, 0.02782, 0.02584, 0.02424, 0.02318, 0.02277, and 0.03129 ohm cm at 2.118, 2.598, 3.046, 3.513, 4.204, 4.206, 4.188, 5.132, 6.487, 7.315, 8.088, 9.144, 10.80, 12.18, 14.30, 15.93, 17.90, 20.28, 21.64, 23.12, 25.31, 27.69, 30.22, 35.90, 42.60, 48.56, 55.08, 76.52, 84.12, 94.16, 106.1, 122.9, 141.4, and 295.4 K, respectively.
73	798	L	1962	1.3-129		As 233 II	As-doped single crystal; 17.053 x 3.9504 x 4.0951 mm; same fabrication method and specimen axis orientation as above; n = 1.7 x 10^{17} cm^{-3}; electrical resistivity reported as 2.81 x 10^4, 1.856 x 10^4, 9742, 2845, 1045, 373.7, 154.4, 36.90, 14.15, 5.802, 1.966, 1.188, 0.8640, 0.5392, 0.3085, 0.2690, 0.2149, 0.1757, 0.1483, 0.1247, 0.1216, 0.1040, 0.09275, 0.06963, 0.05547, 0.04247, 0.03696, 0.03077, 0.02318, 0.02172, 0.02090, 0.01982, 0.01838, 0.01778, 0.01706, 0.01618, and 0.01977 ohm cm at 1.445, 1.578, 1.786, 2.171, 2.526, 2.946, 3.358, 4.202, 5.001, 5.914, 7.468, 8.479, 9.291, 10.84, 13.57, 14.34, 16.14, 18.16, 20.22, 21.61, 23.16, 25.74, 27.78, 33.47, 38.80, 46.49, 51.32, 59.03, 77.25, 82.08, 86.98, 93.10, 103.8, 109.3, 118.6, 132.7 and 297.0 K, respectively.
74	798	L	1962	1.3-76		SbGa 170	Doped with antimony and gallium; single crystal; 19.413 x 4.2278 x 3.7717 mm; same fabrication method and specimen axis orientation as above; n = 5.4 x 10^{16} cm^{-3}; electrical resistivity reported as 2.13 x 10^3, 1.65 x 10^3, 1.29 x 10^3, 1.03 x 10^3, 891, 685, 421, 346, 191.4, 124.0, 86.78, 56.26, 55.66, 41.60, 34.63, 29.32, 20.81, 15.59, 10.58, 8.182, 6.502, 4.978, 4.420, 4.125, 3.534, 3.095, 2.425, 1.884, 1.599, 1.162, 0.8203, 0.5025, and 0.1304 ohm cm at 1.303, 1.389, 1.486, 1.569, 1.637, 1.756, 2.017, 2.141, 2.589, 3.023, 3.475, 4.210, 4.229, 4.884, 5.358, 5.844, 7.091, 8.538, 11.23, 13.66, 16.44, 20.41, 22.42, 23.64, 26.52, 29.17, 34.26, 39.97, 43.96, 52.48, 63.04, 81.42, and 296.4 K, respectively.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
75	784	L	1962	1.3-148	6	SbGa 183	Doped with antimony and gallium; single crystal; 15.65 x 3.7364 x 3.6070 mm; same fabrication method and specimen axis orientation as above; n ~ 1.5 x 10^{17} cm^{-3}; electrical resistivity reported as 25.7, 21.24, 17.78, 14.54, 12.14, 9.619, 6.192, 4.578, 3.538, 2.835, 2.149, 1.750, 1.537, 1.245, 1.038, 0.9525, 0.866, 0.7876, 0.7180, 0.6489, 0.6039, 0.5136, 0.4304, 0.3877, 0.3183, 0.2497, 0.2110, 0.1684, 0.1597, 0.1291, 0.1177, and 0.06187 ohm cm at 1.269, 1.368, 1.487, 1.634, 1.781, 2.022, 2.596, 3.511, 4.206, 5.212, 6.792, 8.398, 9.787, 12.55, 15.94, 17.90, 20.32, 25.16, 26.21, 29.85, 32.83, 39.78, 47.47, 52.55, 62.58, 77.18, 87.21, 108.8, 123.9, 141.9, 161.6, and 296.2 K, respectively.
76	784	L	1962	1.4-151	6	SbGa 204	Doped with antimony and gallium; single crystal; 16.822 x 3.913 x 3.924 mm; same fabrication method and specimen axis orientation as above; n ~ 2.6 x 10^{16} cm^{-3}; electrical resistivity reported as 1.19 x 10^5, 1.04 x 10^5, 6.82 x 10^4, 2.66 x 10^4, 1.27 x 10^4, 7.33 x 10^3, 3857, 3695, 2229, 1712, 1204, 682.2, 457, 241, 171, 120, 80.00, 70.41, 61.69, 51.53, 40.24, 31.79, 21.69, 15.13, 11.37, 7.597, 4.137, 3.777, 3.374, 2.822, 2.260, 1.853, 1.428, 1.161, 0.9402, and 0.4279 ohm cm at 1.934, 1.986, 2.141, 2.589, 3.062, 3.509, 4.201, 4.254, 4.939, 5.365, 6.039, 7.404, 8.655, 11.51, 13.67, 16.27, 20.24, 21.74, 23.32, 25.60, 28.94, 32.41, 33.52, 45.12, 50.76, 59.74, 77.08, 78.86, 84.13, 90.66, 99.63, 108.7, 122.7, 135.9, 152.1, and 293.8 K, respectively.
77	785	L	1962	1.3-4.2		1 N	Sb-doped n-type single crystal; dimensions approx 1 x 2 x 25 mm; specimen axis in [110] direction; lapped and etched; impurity concentration, n ~ 2 x $10^{?}$ cm^{-3}; electrical resistivity 0.13 ohm cm at 300 K.
78	785	L	1962	1.7-3.9		2 N	Similar to the above specimen except specimen axis in [111] direction and electrical resistivity 0.12 ohm cm at 300 K.
79	785	L	1962	1.7-4.1		3 N	Similar to the above specimen except specimen axis in [100] direction, n ~ 1 x 10^{16} cm^{-3}, and electrical resistivity 0.20 ohm cm at 300 K.
80	785	L	1962	2.0-4.0		4 N	As-doped single crystal; dimensions approx 1 x 2 x 25 mm; specimen axis in [110] direction; lapped and etched; n ~ 2 x 10^{16} cm^{-3}, electrical resistivity 0.12 ohm cm at 300 K.
81	785	L	1962	2.1-4.0		5 N	Pure; dimensions approx 1 x 2 x 25 mm; specimen axis in [111] direction; lapped and etched; electrical resistivity 31 ohm cm at 300 K.
82	785	L	1962	2.1-3.9		1 P	p-type; similar to the above specimen except specimen axis in [110] direction and electrical resistivity 47 ohm cm at 300 K.
83	786	L	1958	2.1-87	10-30		Pure germanium crystal; size approx 0.125 x 0.125 x 0.625 in.; provided by the Radio Corporation of America.
84	787, 751		1963	90-300			Germanium crystal; before neutron bombardment.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
85	787, 751		1963	90-300			The above specimen after a bombardment of 6 x 10^{17} neutron cm^{-2}.
86	787, 751		1963	86-270			The above specimen after a bombardment of 1.2 x 10^{18} neutron cm^{-2}.
87	752	P	1962	300-1075		Ge-1810	As-doped n-type single crystal; carrier concentration 5 x 10^{15} atoms cm^{-3}.
88	752	P	1962	317-1075		Ge-1796	Similar to the above specimen except carrier concentration 3 x 10^{19} atoms cm^{-3}.
89	752	P	1962	562-1136		Ge-5	Ga-doped p-type single crystal; carrier concentration 2.4 x 10^{19} atoms cm^{-3}.
90	1010	L	1957	18-94	2		n-type single crystal; specimen dimensions 1.5 x 1.8 x 15 mm; electron concentration approx 10^{14} cm^{-3}; heat flow parallel to [100] direction.
91	788	L	1963	1.3-82	30	CS	Sb-doped single crystal; supplied by Bell Telephone Laboratories; cut into an "L" shape; dimensions of legs approx 5 mm long, 1.2 x 1.2 mm cross section; one leg connected to heat sink (S leg), another leg connected to heater (H leg); S leg perpendicular to H leg; S leg axis aligned in the $\langle \bar{1}\bar{1}2 \rangle$ direction; measurements made on S leg.
92	788	L	1963	1.3-85	30	CH	Data from measurements made on H leg of the above specimen.
93	788	L	1963	1.4-84	30	DS	Similar to the above specimen but with the H leg bent to a circular curvature of radius 3.35 cm; measurements made on the S leg.
94	788	L	1963	1.4-88	30	DH	Data from measurements made on the H leg.
95	789	L	1962	0.2-3.6	5	Ge 2	Same specimen as the one for curve 39.
96	789	L	1962	0.2-3.2	5	Ge 3	Same specimen as the one for curve 40.
97	789	L	1962	0.3-2.9	5	Ge 4	Same specimen as the one for curve 41.
98	789	L	1962	0.2-0.7	5	Ge 5	Same specimen as the one for curve 42.
99	789	L	1962	0.3-3.1	5	Ge 7	Same specimen as the one for curve 43.
100	789	L	1962	0.3-0.8	5	Ge 10	Same specimen as the one for curve 44.
101	789	L	1962	0.2-3.8	5	Ge 11	Same specimen as the one for curve 45.
102	789	L	1962	0.3-4.0	5	Ge 12	Same specimen as the one for curve 46.
103	339, 883	L	1955	5.1-281	< 10 in 4°-20°K and 100°-300°K, < 15 in 20°-100 K.		Sb-doped n-type single crystal, 2 x 4 x 15 mm; long dimension in the $\langle 111 \rangle$ direction; obtained by Czochralski technique; electrical resistivity 0.10 ohm cm.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
104	339, 883, 988	L	1965	4.9-268	<10 in 4°-20°K and 100°-300°K, <15 in 20°-100°K.		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux of 1.1 x 10^{17} n cm^{-2}.
105	339, 883	L	1965	5.0-275	<10 in 4°-20°K and 100°-300°K, <15 in 20°-100°K.		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux of 2.5 x 10^{17} n cm^{-2}.
106	883	L	1957	5.1-287	<10 in 4°-20°K and 100°-300°K, <15 in 20°-100°K.		Similar to the above specimen; irradiated at 30 C with a fast neutron integrated flux of 1.7 x 10^{18} n cm^{-2}.
107	883	L	1957	5.4-500	<10 in 4°-100°K and 100°-300°K, <15 in 100°-300°K.		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux of 3.4 x 10^{20} n cm^{-2}.
108	884	L	1965	47-136		Ge II	High purity n-type single crystal; obtained from Eagle-Picher Company; bar shaped, 0.153 cm wide, 0.048 cm thick; long dimension in the <110> direction; irradiated (base temperature near 47 K, tip temperature < 70 K) for a length of 1 cm in <111> direction with a total electron flux of 1.01 x 10^{18} 2-Mev e cm^{-2}; annealed for 15 min at 175 K; electrical resistivity 50 ohm cm, carrier concentration approx 10^{14} cm^{-3}; measured on warming in the dark from 47 K after the electron traps were filled by a white-light illumination at 47 K.
109	884	L	1965	18-310		Ge I	High purity n-type single crystal; obtained from Eagle-Picher Company; bar shaped, 0.159 cm wide, 0.043 cm. thick; long dimension was the <110> direction; electrical resistivity 50 ohm cm; carrier concentration approx $10^{14}cm^{-3}$.
110	884	L	1965	20-31		Ge I	Same specimen as above; irradiated (base temperature near 20 K, tip temperature < 50 K) for a length of 1 cm in <111> direction with a total electron flux of 3.4 x 10^{18} 2-Mev e cm^{-2}; at 30 K for 15 min.
111	884	L	1965	20-61		Ge I	The above specimen annealed for the second time at 70 K for 15 min.
112	884	L	1965	19-150		Ge I	The above specimen annealed for the third time at 175 K for 15 min.
113	884	L	1965	18-65		Ge I	The above specimen annealed for the fourth time at 325 K for 15 min.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
114	884	L	1965	20-290		Ge I	The above specimen annealed for the fifth time at 405 K for 15 min.
115	884	L	1965	11-298		Ge II	High purity n-type single crystal; obtained from Eagle-Picher Company; bar shaped, 0.153 cm wide, 0.048 cm thick; long dimension in the <1$\bar{1}$0> direction; electrical resistivity 50 ohm cm; carrier concentration approx 10^{14} cm^{-3}.
116	884	L	1965	11-74		Ge II	Same specimen as above; irradiated (base temperature near 47 K, tip temperature ~70 K) for a length of 1 cm in <111> direction with a total electron flux of 1.01 x 10^{18} 2-Mev e cm^{-2}; annealed at 77 K for 15 min.
117	884	L	1965	11-118		Ge II	The above specimen annealed for the second time at 125 K for 15 min
118	884	L	1965	11-131		Ge II	The above specimen annealed for the third time at 140 K for 15 min.
119	884	L	1965	11-171		Ge II	The above specimen annealed for the fourth time at 175 K for 15 min.
120	884	L	1965	11-150		Ge II	The above specimen annealed for the fifth time at 209 K for 15 min.
121	884	L	1965	11-202		Ge II	The above specimen annealed for the sixth time at 230 K for 15 min.
122	884	L	1965	10-303		Ge II	The above specimen annealed for the seventh time at 405 K for 15 min.
123	885		1964	92-300		A	Single crystal.
124	885		1964	89-301		B	Single crystal; irradiated at 70 C for a fast neutron flux of 6 x 10^{15} n cm^{-2}.
125	885		1964	90-271		C	Similar to the above specimen except irradiated at 70 C by a fast neutron flux of 1.2 x 10^{16} n cm^{-2}.
126	887, 886		1964	300			Ga-doped p-type single crystal; carrier concentration 1.29 x 10^{14} cm^{-3}.
127	887, 886		1964	300			Ga-doped p-type single crystal; carrier concentration 1.70 x 10^{19} cm^{-3}.
128	887, 886		1964	300			Ga-doped p-type single crystal; carrier concentration 7.76 x 10^{19} cm^{-3}.
129	887, 886		1964	300			Ga-doped p-type single crystal; carrier concentration 1.12 x 10^{20} cm^{-3}.
130	887, 886		1964	300			As-doped n-type single crystal; carrier concentration 4.07 x 10^{15} cm^{-3}.
131	887, 886		1964	300			As-doped n-type single crystal; carrier concentration 4.37 x 10^{16} cm^{-3}.
132	887, 886		1964	300			As-doped n-type single crystal; carrier concentration 9.77 x 10^{16} cm^{-3}.

SPECIFICATION TABLE NO. 18 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
133	887, 886		1964	300			As-doped n-type single crystal; carrier concentration $3.24 \times 10^{17} cm^{-3}$.
134	887, 886		1964	300			As-doped n-type single crystal; carrier concentration $1.02 \times 10^{19} cm^{-3}$.
135	887, 886		1964	300			As-doped n-type single crystal; carrier concentration $1.51 \times 10^{19} cm^{-3}$.
136	887, 886		1964	300			As-doped n-type single crystal; carrier concentration $6.03 \times 10^{19} cm^{-3}$.
137	888, 889	L	1962	110-317		I 1	Sb-doped n-type single crystal; electrical resistivity 0.0205 - 0.0227 ohm cm at 300 K.
138	888, 889	L	1962	108-304		I 2	Similar to the above specimen.
139	888, 889	L	1962	142-308		I 3	Similar to the above specimen.
140	888, 889	L	1962	121-306		I 4	Ga-doped p-type single crystal; electrical resistivity 0.154-0.155 ohm cm at 300 K.
141	888, 889	L	1962	98-316		I 5	Similar to the above specimen.
142	888, 889	L	1962	122-312		I 6	Similar to the above specimen.
143	888, 889	L	1962	109-307		II 1	Sb-doped n-type single crystal; electrical resistivity 13.9-15.1 ohm cm at 300 K.
144	888, 889	L	1962	118-302		II 2	Similar to the above specimen.
145	888, 889	L	1962	114-304		II 3	Ga-doped p-type single crystal; electrical resistivity 25.4-26.0 ohm cm at 300 K.
146	888, 889	L	1962	131-310		II 4	Similar to the above specimen.
147	888, 889	L	1962	128-306		II 5	Similar to the above specimen.

REMARKS

The recommended values are for high-purity germanium. The values are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures above 40 K. The thermal conductivity near and below the corresponding temperature of its maximum is highly sensitive to small physical and chemical variations of the specimens, and the values below 40 K are intended as typical values for indicating the general trend.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

SPECIFICATION TABLE NO. 19 THERMAL CONDUCTIVITY OF GOLD

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 19]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	95	E	1915	22-374			99.999 pure; electrical conductivity 48.4 and 45.1 x 10^4 $ohm^{-1}cm^{-1}$ at 273.1 and 291 K, respectively.
2	77	E	1900	291,373		Au I	99.8 pure; 0.1 Fe, 0.1 Cu.
3	77	E	1900	291,373		Au II	High purity.
4	146	L	1953	2.7-141	1	Au 1	99.9 pure; major impurity Ag, trace Pt, faint traces of Fe, Cu, and Sn; specimen 2 mm in dia obtained from Garrett, Davidson and Matthey of Sydney.
5	146	L	1953	2.3-150	1	Au 2	The above specimen annealed at 700 C in vacuo and slowly cooled.
6	146	L	1953	2.3-148	1	Au 3	99.999$^+$ pure; spectral analysis showed lines of Ag, and Cu and faint lines of Cd, Fe, Mg, and Na, and very faint lines of Ca and Zn; specimen 1.5 mm dia rod; obtained from Garrett, Davidson and Matthey of Sydney.
7	146	L	1953	2.1-151	1	Au 4	The above specimen annealed at 700 C in vacuo for about 3 hrs and slowly cooled to 200 C in 6 hrs.
8	146	L	1953	2.2-90	1	Au 5	The above annealed specimen cold drawn to 1.3 mm dia.
9	78	E	1931	273-292			99.99 pure; specimen 0.07960 cm in dia and 20.12 cm long.
10	97	L	1952	2.3-21	2-3	Au 1	99.999 pure; polycrystalline wire; *obtained from* Johnson Matthey (JM 1916a).
11	8	L	1914	273-373			Specimen 0.1014 cm in dia; specific gravity 19.49.
12	57	L	1927	21,83		Au 12	High purity; single crystal; unstrained; electrical resistivity reported as 0.0142, 0.488 and 2.04 μohm cm at -252, -190, and 0 C, respectively.
13	57	L	1927	21,83		Au II	Commercially pure; cold-worked and annealed; electrical resistivity reported as 0.1174, 0.599 and 2.16 μohm cm at -252, -190, and 0 C, respectively.
14	172	E	1927	297.2		1a	Specimen 4 mm in dia and 20 cm long; made from forged material and machined to shape; electrical resistivity 2.44 μohm cm at 24 C.
15	172	E	1927	297.2		1b	The above specimen measured after being annealed at 600 C for 1 hr.
16	487	L	1894	326.2			Specimen 2.0 mm dia.
17	246	T	1919	273,373			Rolled and drawn; heated 0.5 hr close to melting point.
18	430	T	1924	273.2			Pure; rolled and drawn to a wire, specimen 3 cm long and 1 mm^2 cross-section, and then heated close to melting point.
19	451		1930	291.2			Pure; tempered at 800 C, quenched, rolled, and drawn.
20	399	L	1925	290,373			Pure.
21	241		1911	298.2			Pure.

SPECIFICATION TABLE NO. 19 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
22	57	L	1927	21, 83		Au 14	High purity; single crystal; unstrained; electrical resistivity reported as 0.0160, 0.490, and 2.04 μohm cm at -252, -190, and 0 C, respectively.
23	57	L	1927	21, 83		Au 13	Originally single crystal, hammered to 2 mm dia; annealed 5.5 hrs at 380 C; electrical resistivity reported as 0.0147, 0.489, and 2.04 μohm cm at -250, -190, and 0 C, respectively.
24	57	L	1927	21, 83		Au IIa	Commercially pure; remelted and hammered to 2 mm dia; annealed; tempered 3 hrs at 390 C; electrical resistivity reported as 0.0941, 0.575, and 2.14 μohm cm at -250, -190, and 0 C, respectively.
25	617		1957	321-964			99.99 pure, polycrystal.
26	683	L	1963	0.418-0.94			99.97 pure, polycrystalline wire.
27	768	L	1964	3.8-15		Oxidized	40 μ thick foils rolled from spec-pure Johnson-Matthey material; annealed at 1223 K for 24 hrs in air, electrical resistance ratio $(R_{273}-R_{4.2})/(R_{4.2})$ = 610; electrical resistivity reported as 25.369, 25.379, 25.390, 25.408, 25.442, 25.496, and 25.529 μohm cm at 2.29, 2.79, 3.20, 3.61, 4.11, 4.68, and 4.90 K, respectively; L_0 = (2.46 ± 0.02) x 10^{-8} watt ohm K^{-2}.
28	768	L	1964	2.4-16		Vacuum annealed	40 μ thick foils rolled from spec-pure Johnson-Matthey material, annealed at 1223 K for 24 hrs in vacuum (pressure 10^{-5} mm Hg); electrical resistance ratio $(R_{273}-R_{4.2})/(R_{4.2})$ = 32.2; electrical resistivity reported as 467.9, 463.8, 461.2, 458.7, 456.9, 455.0, 453.3, 451.9, 450.7, 449.8, 449.0, 448.0, and 448.2 μohm cm at 2.32, 2.79, 3.20, 3.62, 4.0, 4.40, 4.90, 5.38, 5.88, 6.33, 6.80, 7.45, 8.03, and 8.68 K, respectively.
29	736	L	1965	0.39-0.92			Very pure (higher purity than the specimen used by Davey and Mendelssohn 1963); polycrystalline.
30	1005	E	1927	273.2			99.9 pure; specimen 0.125 in. in dia and 10 cm long; obtained from Baker and Co.; electrical resistivity 2.214 μohm cm at 0 C.

REMARKS

The recommended values are for well-annealed 99.999+% pure gold with residual electrical resistivity ρ_0 = 0.00530 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 100 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, a = 0.46, m = 2.46, α'' = 4.60 x 10^{-5}, and β = 0.225. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 6% at other temperatures.

*T_1 in K, k_1 in Watt $cm^{-1}K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1}ft^{-1}F^{-1}$.

‡Values in parentheses are extrapolated or estimated.

REMARKS

The recommended values are for well-annealed 99% pure hafnium with residual electrical resistivity ρ_0 = 4.23 μΩ cm (characterization by ρ_0 becomes important below room temperature). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm⁻¹ K⁻¹, T_2 in F, and k_2 in Btu hr⁻¹ ft⁻¹ F⁻¹. ‡ Values in parentheses are extrapolated or interpolated.

REMARKS

The recommended values are for well-annealed 99.9% pure holmium with residual electrical resistivity ρ_0 = 7.32 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 10 to 15% of the true values.

[†] T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}. [‡] Values in parentheses are extrapolated or estimated.

SPECIFICATION TABLE NO. 22 THERMAL CONDUCTIVITY OF INDIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 22]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	132	L	1955	1.3-4.2	±2.5		99.95 pure; single crystal; cylindrical specimen; obtained from Stout, J.W. and Guttman, L.; residual electrical resistivity 0.0371 μohm cm; measured in a vacuum of < 5 x 10^{-7} mm Hg and in a longitudinal magnetic field of approx 1000 oersteds; in normal state; data from smoothed curve.
2	132	L	1955	1.3-3.2	±2.5		The above specimen measured in superconducting state; data from smoothed curve.
3	76	L	1952	1.7-5			99.9⁺ pure; single crystal; supplied by Stout, J.W. and Guttman, L.; transition temp 3.40 K; measured in a magnetic field of ~100 gauss; in normal state.
4	76	L	1952	1.9-3.4			The above specimen measured in superconducting state.
5	97	L	1952	2.1-33	2-3	JM 4398; In 1	99.993 pure; polycrystalline; 1-2 mm dia x 5 cm long; supplied by Johnson Matthey; in normal state.
6	97	L	1952	2.3-3.3		JM 4398; In 1	The above specimen measured in superconducting state.
7	794, 400	L	1953	0.46-0.87		JM 4396; In 2	99.993 pure; single crystal; in superconducting state; preliminary result.
8	342	L	1953	2.2		JM 4398; In 1	99.993 pure; polycrystalline; 1-2 mm dia x 5 cm long; supplied by Johnson Matthey; annealed in vacuo; measured in transverse magnetic fields of strength ranging from 0.34 to 2.87 kilooersteds kOe.
9	342	L	1953	2.8		JM 4398; In 1	The above specimen measured in magnetic fields of strength ranging from 0.34 to 2.87 kOe.
10	342	L	1953	3.25		JM 4398; In 1	The above specimen measured in H ranging from 1.10 to 3.94 kOe.
11	290, 285	L	1952	2.13		JM 3249; In	Pure; single crystal; 2.8 mm dia; spectroscopically standardized indium supplied by Johnson Matthey; cast; somewhat strained in mounting; electrical resistivity ratio $\rho(273 K)/\rho(4.2 K) = 5500$; measured in transverse magnetic fields of strength ranging from 0 to 190 gauss.
12	290, 285	L	1952	2.13		JM 3249; In	The above specimen measured in transverse fields of decreasing strength ranging from 184 to 0 gauss.
13	795	L	1962	89-342	~2		Total impurity < 0.03 (probably Sn and Pb); ~0.85 cm dia x 6.5 cm long; supplied by Johnson Matthey; electrical resistivity reported as 1.65, 3.08, 4.60, 6.22, 8.0, 10.0, 12.15, and 13.0 μohm cm at 73, 123, 173, 223, 273, 323, 373, and 393 K, respectively; Lorenz function reported as 2.46, 2.60, 2.62, 2.60, 2.57, 2.59, 2.61, and 2.61 x 10^{-8} V ohm K^{-2} at the above temps, respectively; density 7.334 g cm^{-3}.
14	795	C	1962	303-390	~2		The above specimen measured in another apparatus; Armco iron used as comparative material.

SPECIFICATION TABLE NO. 22 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
15	454	L	1958	0.26-0.56	2	JM 10281; A0	Spectroscopically pure; single crystal; 4.79 mm dia; indium supplied by Johnson Matthey; cast, crystallized; annealed in air at 120 C and electropolished; residual electrical resistivity 0.00125 µohm cm; in superconducting state.
16	454	L	1958	0.27-0.58	2	JM 10281; A1	The above specimen etched with 25% H_2SO_4 solution; in superconducting state.
17	454	L	1958	0.36-0.59	2	JM 10281; A2	The above specimen etched with 25% H_2SO_4 solution and annealed at 120 C for 9 days; in superconducting state.
18	454	L	1958	0.32-0.65	2	JM 10281; A3	The above specimen electropolished (dia reduced to 1.86 mm); damaged by bending during reduction; in superconducting state.
19	454	L	1958	0.34-0.65	2	JM 10281; A4	The above specimen etched with 25% H_2SO_4 solution; in superconducting state.
20	454	L	1958	0.30-0.74	2	JM "chem pure"; B0	99.9 pure (by difference); single crystal; 3.13 mm dia; supplied by Johnson Matthey; cast, crystallized, electropolished, and annealed in air at 120 C; in superconducting state.
21	454	L	1958	0.30-0.76	2	JM "chem pure"; B1	The above specimen etched with 25% H_2SO_4 solution; in superconducting state.
22	412	L	1955	0.25-0.93		JM 4938	99.993 pure; single crystal; ~1 mm dia x 4 cm long; made from Johnson Matthey metal; in superconducting state.
23	412	L	1955	0.29-0.79		JM 4938	99.993 pure; polycrystal; 1.6 mm dia x 4 cm long; made from Johnson Matthey metal; in superconducting state.
24	796	L	1964	313-417	7-8		99.997 pure.
25	797, 798	L	1960	1.4-3.3			Spectroscopically pure; polycrystalline; ~0.5 mm in dia; extruded; annealed at room temp for several months; electrical resistivity ratio ρ(room temp)/ρ(0 K) estimated to be 11000; in superconducting state.
26	797, 798	L	1960, 1961	1.4-4.0			The above specimen measured in a longitudinal magnetic field; in normal state (data corrected to zero field).
27	799	L	1965	1.6-4.0	2	In 1	Bi as major impurity; specimen ~3 mm dia; In supplied by American Smelting and Refining Co.; cast in vacuum; annealed near melting point for at least 2 wks; residual electrical resistivity 0.122 µohm cm; transition temp 3.39 K; measured in a magnetic field; in normal state.
28	732	L	1965	0.023-0.70			99.999 pure (nominal); 0.5 mm dia x 5 cm long; supplied by Koch-Light Laboratories Ltd. (Colnbrook, England); measured in a longitudinal magnetic field of 350 gauss; in normal state.
29	892, 893	L	1963	312-415	7-8		99.997 pure.

REMARKS

The recommended values are for well-annealed high-purity indium with residual electrical resistivity ρ_0 = 0.000828 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 80 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

[*] T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu lb^{-1} ft^{-1} F^{-1}. [‡] Values in parentheses are extrapolated, interpolated, or estimated.

THERMAL CONDUCTIVITY OF IRIDIUM

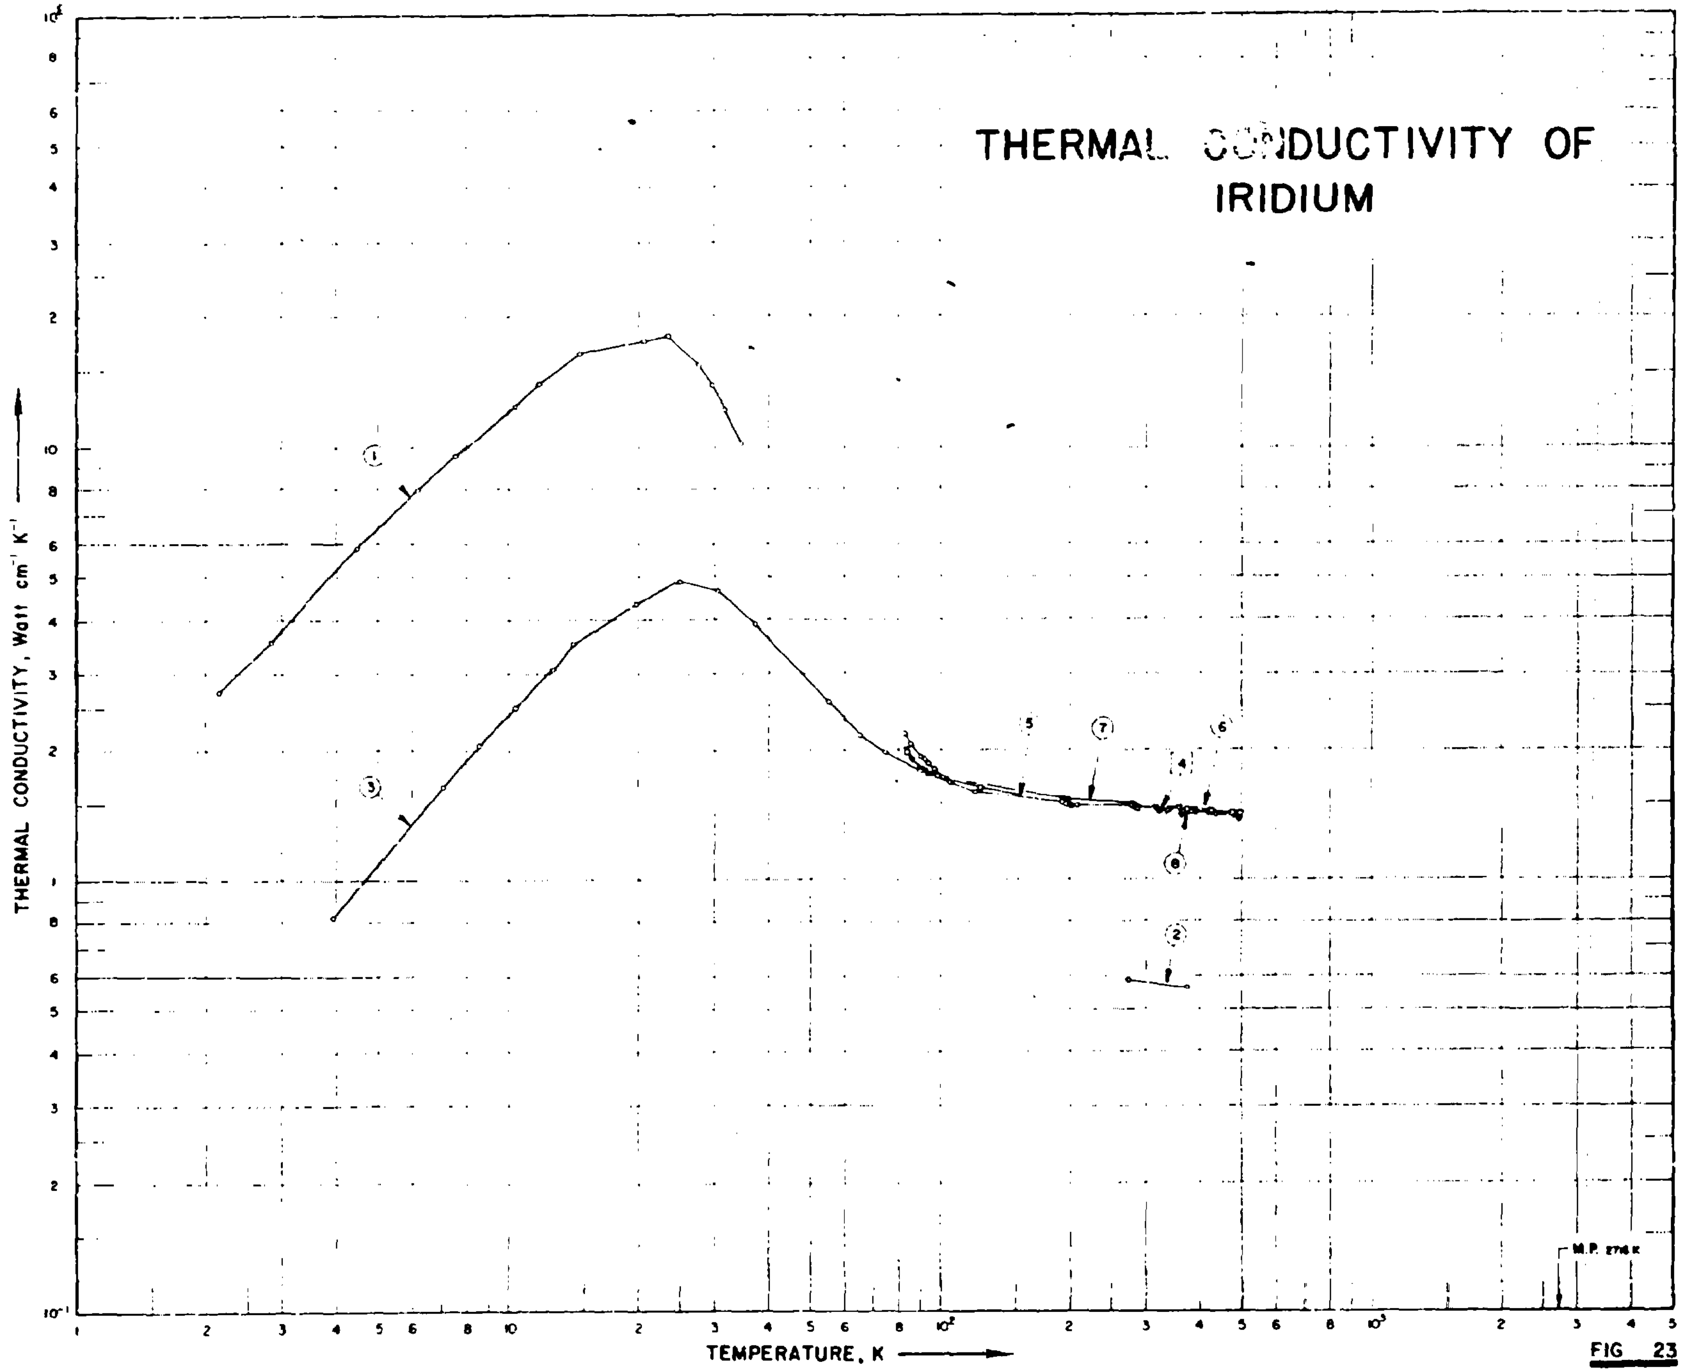

FIG 23

SPECIFICATION TABLE NO. 23 THERMAL CONDUCTIVITY OF IRIDIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 23]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	97	L	1952	2.2-35	2.0-3.0	JM 3441; Ir 1	99.995 pure; 1-2 mm dia x 5 cm long; supplied by Johnson Matthey; annealed.
2	8	F	1914	290, 373			Pure; square cross section 0.103 x 0.103 cm. 10.0 cm long; specific gravity 22.33; electrical resistivity reported as 8.190, 8.480, 10.521, and 10.59 μohm cm at 0, 12.11, 97.20, and 100 C, respectively.
3	149	L	1957	3.9-90		JM 10371; Ir 2	99.98⁺ pure; approx impurities: 0.01 [illegible], 0.002 Pt, and 0.001 Cu; 2 mm dia x 5-7 cm long; supplied by Johnson Matthey; annealed at 1300 C; residual electrical resistivity (ρ_0) - 0.1034 μohm cm; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 49.5; Lorenz function 2.50 x 10^{-8} V^2 K^{-2} at 0 K.
4	411	C	1955	323.2			Impurities estimated: 0.02-0.05 Rh, 0.002-0.005 Ru, and 0.001 Pd; 5 cm long, 0.3182 cm in dia; supplied by Johnson Matthey; annealed at 1313 C; density 22.49 g cm^{-3}.
5	411	L	1955	83-289	<3.1		The above specimen; electrical resistivity reported as 0.79, 0.85, 0.95, 1.00, 1.02, 1.10, 1.20, 1.29, 1.59, 3.05, 3.17, 3.31, 3.43, 4.82, 4.92, and 5.07 μohm cm at -190.5, -187.5, -183.2, -180.8, -179.6, -175.8, -171.2, -166.9, -152.7, -82.2, -77.0, -70.0, -64.1, 4.3, 8.8, and 16.1 C, respectively.
6	665	L, C	1962	83-493			0.02-0.05 Rh, 0.002-0.005 Ru, and 0.001 Pd; 5.0 cm long, 0.318 cm in dia; supplied by Johnson Matthey; heated to 1310 C; density 22.43 g cm^{-3}; electrical resistivity 4.71 μohm cm at 273 K; residual electrical resistivity 0.055 μohm cm; data obtained by using two methods of measurement for low and moderate temp ranges; Armco iron used as comparative material for the moderate temp measurement.
7	249	L	1967	83-386			0.02-0.05 Rh, 0.002-0.005 Ru, and 0.001 Pd; specimen 0.318 cm in dia and 5 cm long; supplied by Johnson Matthey; annealed at 1590 K; density 22.43 g cm^{-3}; electrical resistivity ratio ρ(273 K)/ρ(4.2 K) - 85.7; electrical resistivity reported as 1.16, 3.25, 5.33, 7.39, and 9.42 μohm cm at 100, 200, 300, 400, and 500 K, respectively.
8	249	C	1967	315-492			The above specimen measured in a comparative apparatus using Armco iron as reference material.

400	1.44	83.2	260.3				

REMARKS

The recommended values are for well-annealed 99.995% pure iridium with residual electrical resistivity ρ_0 = 0.0188 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 3.00, α' = 0.0175 x 10^{-4}, and β = 0.770. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

---

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$. ‡Values in parentheses are extrapolated or estimated.

SPECIFICATION TABLE NO. 24 THERMAL CONDUCTIVITY OF IRON

(Impurity < 0.20% each; total impurities < 0.50%)

(For Data Reported in Figure and Table No. 24)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	115	L	1951	26-292			99.99 pure; supplied by Johnston Mackay Ltd.
2	~~1010~~ 1014	L	1968	82-373	1.6	18 AF3	99.96 Fe, 0.007 Cu, 0.007 Ni, 0.0058 C, 0.004 Mn, 0.004 Si, 0.003 S, 0.0023 N, 0.002 Cr, 0.001 Al, 0.001 P, and 0.0008 O; 1.247 cm dia x 10.44 cm long; prepared by National Physical Laboratory, England; as received; density 7.872 g cm^{-3} at 24 C; electrical resistivity reported as 0.925, 5.26, 8.97, and 10.33 μohm cm at 77.78, 194.8, 273.3, and 298.8 K, respectively; Lorenz function reported as 1.625, 1.885, 2.420, 2.704, and 2.884 x 10^{-8} V^2 K^{-2} at 70.2, 100, 200, 300, and 389.8 K, respectively; measured in a vacuum of 5 x 10^{-6} torr.
3	1	L	1935	273-473	2		0.0045 C, 0.002 Mn, 0.0015 S, 0.001 P, 0.0006 Ni, 0.0002 Si, traces of Al and Mg; 1 cm dia x 15 cm long; density 7.871 ± 0.002 g cm^{-3}; electrical resistivity reported as 11.5, 14.5, and 17.8 μ ohm cm at 50, 100, and 150 C, respectively; data taken from smoothed curve.
4	129, 161	C	1933	373-772	5	Basic open hearth Iron	0.042 P, 0.03 Mn, 0.02 C, and 0.005 S; hot-rolled to 1 in. bar; high purity lead used as comparative material; data taken from smoothed curve.
5	5	L	1947	320-1016	1.95	Armco Iron	99.808 Fe (by difference), 0.067 Cu, 0.039 S, 0.035 Mn, 0.028 C, and 0.024 Ni; 2.50 cm dia x 8.00 cm long; machined from a hot-rolled 1.5 in. rod.
6	39	R	1958	371-1594	2	Armco Iron	Specimen consisted of three annular rings each of 0.625 in. I.D., 3.0 in. O.D., and 1 in. thick.
7	34	L	1927	80,273		Electrolyte iron; 1	Coarse-grained; electrical conductivity reported as 121 and 10.4 x 10^4 $ohm^{-1}cm^{-1}$ at 80 and 273 C, respectively.
8	34	L	1927	80,273		Electrolyte iron; 2	Fine-grained; electrical conductivity reported as 121 and 10.4 x 10^4 $ohm^{-1}cm^{-1}$ at 80 and 273 C, respectively.
9	34	L	1927	80,273		Electrolyte iron; 3	Obtained from Firma Heraeus; electrical conductivity reported as 61.2 and 9.4 x 10^4 $ohm^{-1}cm^{-1}$ at 80 and 273 C, respectively.
10	81	L	1939	4.9-23		Electrolyte iron	Extremely pure; 2.545 mm dia x 12.32 cm long; electrical resistivity ratio $\rho(273\ K)/\rho_0$ = 29.4.
11	21	R	1951	718-1008	± 1	Armco Iron	Annular cylindrical specimen of 1.5 in. I.D., 6 in. O.D., and 2.25 in. thick.
12	91	C	1951	111-394		Armco Iron	0.035 Cu, 0.026 S, 0.015 Mn, 0.014 C, and 0.004 P; 2 cm dia x 15 cm long; Armco iron used as comparative material.
13	69	L	1937	323-961	1	Armco Iron; 1	0.032 Mn, 0.03 S, 0.015 C, 0.013 Cu, 0.01 Si, and 0.003 P; 1.4 cm dia x 10 cm long; annealed at 950 C.
14	69	L	1937	304-943	1	Armco Iron; 2	Similar to the above specimen.
15	77	E	1900	291,373		Fe I	0.1 C; 1.3007 cm dia x 27.0 cm long; density 7.84 g cm^{-3} at 18 C; electrical conductivity reported as 8.357 and 5.950 x 10^4 $ohm^{-1}cm^{-1}$ at 18 and 100 C, respectively.

SPECIFICATION TABLE NO. 24 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	104	E	1951	16-93		6936	99.93 pure; forged measured in a vacuum of 5 x 10^{-6} mm Hg.
17	57	L	1927	21, 83		Fe 1	Electrolytically refined; cold-worked and annealed; electrical resistivity reported as 0.1681, 0.778, and 8.71 μohm cm at -252, -190, and 0 C, respectively.
18	57	L	1927	21, 83		Fe 2	Technically pure; polycrystalline; electrolytically precipitated; electrical resistivity reported as 0.1437, 0.929, and 9.11 μohm cm at -252, -190, and 0 C, respectively.
19	79	E	1933	90-273		Armco Iron	0.056 Cu, 0.026 S, 0.017 Mn, 0.011 C, 0.006 P, and 0.002 Si; 0.3924 cm dia x 14.53 cm long; electrical resistivity reported as 1.531, 5.74, 9.57, and 15.49 μohm cm at -183.00, -78.50, 0, and 100 C, respectively.
20	699	L	1965	88-300			0.064 O, 0.0027 C, 0.002 S, 0.001 Mn, 0.001 N, 0.001 Si, and trace Cr; electrical resistivity as 1.22, 5.60, 6.50, 7.65, 8.96, 10.0, 11.3, 12.5, and 13.6 μohm cm at 83, 203, 223, 248, 273, 293, 313, 333, and 353 K, respectively.
21	89	C	1956	273-1273			99.906 Fe (by difference), 0.035 Cu, 0.026 S, 0.015 Mn, 0.014 C, and 0.004 P; measured in a vacuum of ~2 x 10^{-5} mm Hg; a section of the specimen used as comparative material.
22	83	L	1956	1.5-128		JM 5092	99.99 Fe; 0.005 Ni, 0.0002 Cu, 0.0001 Ag, traces of Mn and Mg; 2 mm dia rod supplied by Johnson Matthey and Co.; annealed at 750 C for 4 hrs in vacuo; electrical resistivity reported as 0.248 and 10.0 μohm cm at 4.2 and 293 K, respectively.
23	131	C	1953	323-1073	2	Swedish Iron	0.028 Si, 0.026 C, 0.021 P, 0.02 Mn, and 0.011 S; annealed in vacuum at 990 C; advance (55 Cu-45 Ni) used as comparative material.
24	71	L	1917	303-1107		Swedish Iron	Pure; cylindrical specimen of 1 cm dia x 8 cm long with a cavity of 6 mm dia x 16 mm long in its middle portion; electrical resistivity reported as 15.3, 20.0, 23.1, 26.3, 32.0, 36.4, 43.6, 45.3, 53.1, 61.6, 76.4, 80.7, 90.2, 92.1, 98.7, 100.0, 100.7, 102.2, 105.8, 108.6, 110.3, 111.3, 112.9, 113.8, 114.5, 115.1, 115.8, and 117.0 μohm cm at 30.94, 140, 183, 254, 302, 375, 390, 462, 527, 627, 660, 700, 709, 742, 746, 751, 760, 772, 789, 810, 817, 851, 851, 862, 888, 890, and 901 C, respectively.
25	122	L	1955	2.0-93	± 3	JM 4975; Fe 1	99.99 pure; polycrystal; 0.202 cm dia x 2.89 cm long; supplied by Johnson-Matthey; annealed in vacuo for several hours at two thirds the melting temperature; electrical resistivity ratio ρ(293K)/ρ(20K) = 67.8.
26	110, 476	L	1934	273-1073	2	Armco Iron	99.918 Fe, 0.025 Mn, 0.023 C, 0.020 S, 0.007 P, and 0.007 Si; 2.895 in. dia x 84 in. long; made from two similar rods of Armco ingot iron each 3 in. dia x 42 in. long; electrical resistivity reported as 9.6, 15.0, 22.6, 31.4, 43.1, 55.3, 69.8, 87.0, and 105.5 μohm cm at 0, 100, 200, 300, 400, 500, 600, 700, and 800 C, respectively.
27	251, 260	P	1959	300-1298		Armco Iron; V	0.1875 in. dia x 2 in. long; machined from Armco stock supplied by Mapes and Sprowl Steel Co.; Curie point 770 C; transition point (α-γ) 910 C; measured in a vacuum of ~5 x 10^{-4} mm Hg; thermal conductivity values calculated from measured thermal diffusivity data and specific heat values taken from literature.
28	251	P	1959	295, 1255		Armco Iron; IV	Similar to above.

SPECIFICATION TABLE NO. 24 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
29	1004		1966	629-973		Armco Iron	No details reported.
30	1005	E	1927	273.2			0.125 in. dia x 10 cm long; electrical resistivity 15.8 μohm cm at 0 C.
31	444	C	1939	512-1046		Armco Iron	99.918 Fe, 0.025 Mn, 0.023 C, 0.020 S, 0.007 P, and 0.007 Si; 1.28 cm dia x 14 cm long; machined; lower section of the specimen used as comparative material.
32	444	C	1939	730-1138		Armco Iron	Similar to above except specimen of 1 in. dia.
33	444	R	1939	369-1278		Armco Iron	Specimen consisted of two superimposed disks of 1.1 cm I.D., 6.3 cm O.D., and 2.54 cm thick, machined from the similar original rods as above.
34	163	L	1936	303-1473		D	0.05 Cu, 0.040 S, 0.02 Mn, 0.011 P, 0.01 C, and trace of Si.
35	163	L	1936	303-1473		PD 00	0.08 Mn, 0.022 S, 0.02 C, 0.016 P, and 0.01 Si.
36	253	L	1959	6.5-90		Electrolytic Iron; 1	28 x 2.5 x 2.5 mm; doubly refined; cut out of a precipitated plate, annealed at 950 C, compressed, and reannealed in vacuo at 950 C; electrical resistivity ratio $\rho(273\ K)/\rho_0$ = 84.7 ~104.2; residual electrical resistivity 0.09 ~0.10 μohm cm; specimen believed to be from the same material as that of Grüneisen, E. and Goens, E. (see curve No. 17).
37	253	L	1959	7.9-90		2	Similar to the above specimen except dimensions 30 x 2.4 x 1.7 mm, and electrical resistivity reported as 0.092, 0.097, 0.100, 0.106, 0.120, 0.269, 0.368, 0.631, 0.744, 1.06, and 10.3 μohm cm at 4.2, 15.2, 20.8, 26.1, 32.5, 54.4, 61.2, 74.2, 79.1, 90.2, and 293.0 K, respectively.
38	276	C	1953	343	3	Armco Iron	Pure; density (25 C) = 7.9 g cm^{-3}.
39	217	C	1959	410-1057	4	Armco Iron	99.745 Fe, 0.16 Cu, 0.03 C, 0.03 S, 0.015 Si, 0.01 Mn, and 0.01 P; obtained from commercial source in wrought form; iron used as comparative material (data of H.W. Deem).
40	64	L	1900	301,331			99.93 Fe, 0.059 C; density 7.785 g cm^{-3}.
41	203	L	1957	300	± 1.5	Armco Iron	Commercial Armco iron; electrical conductivity 9.09 x 10^4 ohm^{-1}cm^{-1} at 300 K.
42	340	L	1956	355-800	5	Armco Iron	0.75 in. dia rod.
43	97	L	1952	2.3-32	2-3	JM 4975; Fe 1	99.99 pure; 1-2 mm dia x ~5 cm long; supplied by Johnson Matthey; annealed.
44	445	L	1960	303-1273	± 2.5	Armco Iron	0.083 Cu, 0.030 Mn, 0.023 S, 0.006 P, 0.004 Si, 0.02 C; specimen in two halves each of length 7.156 cm and dia 2.324 cm; supplied by BMI; annealed for 0.5 hr at 850 C; electrical resistivity reported as 10.4, 15.6, 22.9, 32.0, 42.9, 55.7, 70.3, 87.9, 106.0, 112.0, and 115.3 μohm cm at 0, 100, 200, 300, 400, 500, 600, 700, 800, 900, and 1000 C, respectively; measured in a vacuum of 0.2-3 x 10^{-5} mm Hg.
45	446	R	1959	855-1198		Armco Iron	Specimen consisted of three stacked hollow cylinders each of 2.5 in. O.D. and 2.5 in. high.

SPECIFICATION TABLE NO. 21 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
46	356	R	1956	372-1172	± 7		Pure.
47	439	L	1935	373-973	2		0.034 Mn, 0.03 C, 0.012 S, 0.005 P, and 0.003 Si.
48	635	R	1957	373-1173	0.5		Pure.
49	625		1960	904-1108	± 14	Armco Iron	No details reported.
50	504	P	1961	295	± 5	Armco Iron	1.9 x 1.9 x 0.100 cm; thermal conductivity values calculated from measured data of thermal diffusivity and specific heat, and density 7.87 g cm^{-3} taken from Smithsonium Physical Tables (9th ed., 1954).
51	673	E	1932	289.6	± 1.3	Electrolytic iron	Wire specimen of 200 mm long.
52	591	C	1963	338.2	± 1.8		99.82 pure; 0.500 in. dia x 3 in. long; hot-rolled; measured in a vacuum of < 5 x 10^{-4} mm Hg; nickel-plated copper used as comparative material.
53	626	P	1960	995-1298	± 2	Armco Iron	0.1875 in. dia x 2 in. long; machined from rod stock Armco iron obtained from Mapes and Sprowl; thermal conductivity values calculated from measured thermal diffusivity data and specific heat values of Darken, L.S. and Smith, R.P. (Ind. Eng. Chem., 43, 1815, 1951).
54	627	R	1964	385-1992	± 4.9	Armco Iron	0.1 Cu, 0.1 Ni, 0.086 O, 0.05 Mn, < 0.05 Al, < 0.05 Cr, < 0.05 Mo, 0.023 S, < 0.02 Si, < 0.02 V, 0.013 C, < 0.01 Ti, 0.006 P, 0.0050 N, and < 0.0001 H; grain size 20-40 μ; electrical resistivity reported as 3.2, 5.3, 7.6, 10.2, 12.6, 15.9, 19.4, 23.3, 27.8, 32.7, 38.2, 44.0, 50.3, 56.7, 64.1, 72.0, 80.7, 90.2, 101.2, 108.7, 112.4, 114.5, 116.2, and 117.7 μohm cm at -150, -100, -50, 0, 50, 100, 150, 200, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750, 800, 850, 900, 950, and 1000 C, respectively; run no. 1.
55	627	R	1964	484-1198	± 4.9	Armco Iron	The above specimen; run No. 2A.
56	627	R	1964	973-1206	± 4.9	Armco Iron	The above specimen; run No. 2B.
57	627	R	1964	1206-1273	± 4.9	Armco Iron	The above specimen; run No. 2C.
58	527	R	1964	1025-1198	± 4.9	Armco Iron	The above specimen; run No. 2D.
59	57	L	1927	21,83		Fe 3	Polycrystalline; made by electrolytic method; hammered; tempered for 1 hr at 500 C; electrical conductivity reported as 1.060, 1.917, and 9.95 μohm cm at -252, -100, and 0 C, respectively.
60	664	E	1957	385-870	± 4	Armco Iron	0.045 S, 0.04 C, and 0.005 P; electrical resistivity reported as 16.36, 22.87, 32.13, 41.00, 53.48, 54.10, and 67.15 μohm cm at 111.7, 203, 301, 390, 493, 499, and 597 C, respectively.
61	634	R	1962	648-1263	± 10	Armco Iron	Specimen size 2 in. O.D., 3 in. long with a 0.5 in. center hole.
62	634	R	1962	753-1323	± 10	Armco Iron	The above specimen measured by using different heat sink.

SPECIFICATION TABLE NO. 21 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
63	661	R	1964	93-1273			0.012 O, 0.008 P, 0.007 C, 0.007 Al, 0.004 S, and 0.002 N; test disks annealed for several hrs at 900 C; electrical resistivity reported as 1.1, 1.7, 2.4, 3.1, 4.0, 5.0, 5.9, 6.9, 7.9, 8.8, 9.87, 11.6, 14.7, 18.1, 21.4, 26.0, 30.1, 35.0, 40.3, 46.8, 53.3, 60.1, 68.0, 76.0, 84.6, 94.2, 102.1, 106.3, 109.0, 111.1, and 113.1 μohm cm at -180, -160, -140, -120, -100, -80, -60, -40, -20, 0, 20, 50, 100, 150, 200, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750, 800, 850, 900, 950, and 1000 C, respectively.
64	660	P	1964	273-1373		Armco Iron	Armco iron obtained from BMI; thermal conductivity values calculated from thermal diffusivity and specific heat using density value 7.874 g cm^{-3} given by Cleaves and Thompson measured data of (The Metal-Iron, McGraw-Hill, p. 271, 1935).
65	636	L	1954	316.2			0.01 Si, traces of Ni, Cu, Al, Mn, Mo, and Ti (in order of decreasing amounts); 0.4 cm dia x 3.5 cm long; prepared by repeated electrolyses, machined; density 7.874 g cm^{-3}.
66	629	R	1956	803-1048		Armco Iron	Disk specimen.
67	40, 43	L	1956	808-1153		Armco Iron	6.75 in. dia x 1.5 in. thick.
68	217		1959	373-773		Armco Iron	Measured by Robinson, H.E., NBS.
69	631	L, C	1962	73-1273		Armco Iron	99.834 (by difference) Fe, 0.083 Cu, 0.030 Mn, 0.023 S, 0.02 C, 0.006 P, and 0.004 Si; chemical and spectrographic analysis at NPL showed 0.083 Ni in addition to the above; 1 in. rod from American Rolling Mill Co. in hot-rolled condition; annealed for 30 min at 1600 F (871 C) in air, followed by furnace cooling; electrical resistivity reported as 1.5, 3.3, 5.3, 7.5, 10.0, 12.5, 15.6, 19.1, 23.0, 27.0, 31.2, 36.3, 41.8, 47.4, 54.0, 61.0, 68.8, 77.2, 86.2, 96.8, 105.2, 109.8, 112.4, 114.1, and 115.8 μohm cm at -200, -150, -100, -50, 0, 50, 100, 150, 200, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750, 800, 850, 900, 950, and 1000 C, respectively; data taken from smoothed curve.
70	632, 900	L	1963	113-913		Armco Iron	99.834 Fe (by difference), 0.083 Cu, 0.030 Mn, 0.023 S, 0.02 C, 0.006 P, and 0.004 Si; specimen 37 cm in length and 2.386 cm in dia; obtained from the American Rolling Mill Co. by Battelle Memorial Institute in the form of 1 in. rod; annealed for 1/2 hr at 1123 K; data taken from smoothed curve.
71	624		1959	323-673		Armco Iron	Polycrystalline.
72	633	L	1963	373-1273		Armco Iron	Corrected values for the temperature variation on the data (Curve 44) of Laubitz, 1960.
73	670	L	1965	6.5-198		A-I	99.998+ Fe, < 0.0020 O, < 0.0006 N, 0.0004 C, 0.00015 Co, 0.00011 Cu, 0.000065 Cr, 0.00002 Ti, 0.000019 Ge, and 0.000018 V; polycrystalline; specimen 0.305 cm in dia made from commercial electrolytic iron; fabricated by swaging to 0.483 cm dia with intermediate annealing treatments in Pd-purified hydrogen, and after the final annealing at 650 C for 1/2 hr, a 0.305 cm dia gauge section was chemically polished into the specimen; final equiaxed grain size about 0.1 mm; electrical resistivity ratio $\rho(297K)/\rho(4.2K) = 302$.

SPECIFICATION TABLE NO. 24 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
74	670	L	1965	6.5-78		A-II	The second run of the above specimen.
75	670	L	1965	6.0-193		B	99.925 Fe, 0.0230 C, 0.0140 O, 0.0116 S, 0.0100 Si, 0.0040 P, 0.0023 Cu, 0.0017 Ti, 0.0016 Zr, 0.0013 Ge, 0.0010 Ni, 0.0009 Cr, 0.0009 Mg, 0.0007 Mn, 0.0005 As, 0.0004 Co, and 0.0003 Ca; polycrystalline; specimen made by vacuum melting commercial electrolytic iron in the conventional fashion; annealed; electrical resistivity ratio, $\rho(297K)/\rho(4.2K) = 27.1$.
76	671	L	1961	100-280			"Very pure"; manufactured by Philips Research Labs, Eindhoven, Holland; wire 2.5 mm in dia; annealed at about 500 C for 10 hrs; electrical resistivity 9.8 μohm cm at 20 C.
77	671	L	1961	100-280			Spectroscopically standardized iron from Johnson, Matthey and Co.; rod 5.0 mm in dia; annealed at about 500 C for 10 hrs; electrical resistivity 9.9 μohm cm at 20 C.
78	695, 696	R	1965	425-773		Armco Iron	99.865 Fe (by difference), 0.07 Mn, 0.04 Si, 0.015 C, and 0.01 Cu; specimen consisted of two disks each with a length of 20 mm.
79	683		1963	0.42-0.95			99.97 pure; polycrystalline wire.
80	706	L	1881	273, 373			Electrical conductivity 10.37 and 6.628 x 10^4 ohm^{-1}cm^{-1} at 0 and 100° C (author reported 10.37 and 6.628 x 10^5, probably a typographical error).
81	841	L	1967	316-483		Pure iron No. 1	0.0250 Ni, 0.0100 Cu, 0.0100 Mo, 0.0070 Cr, 0.0050 C, 0.0040 O, 0.0040 S, 0.0040 V, 0.0030 P, 0.0010 Mn, < 0.0010 Si, 0.0006 N, and 0.000048 H; 1.27 cm dia x 15 cm long; supplied by Metals Research; electrical resistivity reported as 11.7, 14.7, 17.9, 21.6, and 25.6 μohm cm at 50, 100, 150, 200, and 250 C, respectively.
82	841	L	1967	307-499		Pure iron No. 2	0.0055 Ni, 0.0053 Si, 0.0038 Al, 0.0035 S, 0.0020 Co, 0.0017 P, 0.0014 C, 0.0010 Cr, < 0.0010 Mn, 0.0008 O, 0.0007 N, and 0.000016 H; short rod of 1.27 cm dia; prepared by Metallurgy Division of National Physical Laboratory; machined from disk; electrical resistivity reported as 11.9, 14.5, 18.2, 21.8, 25.8, 30.3, 41.0, 53.3, 67.9, 85.2, and 104.2 μohm cm at 50, 100, 150, 200, 250, 300, 400, 500, 600, 700, and 800 C, respectively.
83	841	L	1967	323-573		Pure free iron	0.0800 Si, 0.0300 C, 0.0150 P, 0.0100 Mn, and 0.0100 S; 2.54 cm dia x 20 cm long; supplied by Low Moor Best Yorkshire Iron Limited; electrical resistivity reported as 15.8, 18.7, 22.0, 25.9, 30.0, 34.6, 45.0, 57.1, 71.0, 87.5, and 107.2 μohm cm at 50, 100, 150, 200, 250, 300, 400, 500, 600, 700, and 800 C, respectively.
84	894	R	1964	332-1173	1	High purity iron	0.001 ~ 0.01 Ni, 0.001 ~ 0.01 Si, 0.003 C, 0.003 S, 0.0025 O, 0.0011 P, 0.0001 ~ 0.001 Al, 0.0001 ~ 0.001 Ca, 0.0001 ~ 0.001 Cu, 0.0005 N, 0.0001 H; prepared by arc-melting Armco iron stock in pure inert atmosphere to produce pancake shaped billets, rolled into sheets and cut to make feed stock for electron-beam melting, then cast into 4 in. dia x 6 in. long billet, trimmed off outside edges and machined from center portion two disks of dimensions 3.25 in. dia x 1.130 in. thick and 3.25 in. dia x 1.450 in. thick, four Armco iron disks added as end backup disks to form specimen column of 9 in. high, consisted of six disks in total; electrical resistivity reported as 1.037, 5.17, 9.04, 10.35, 11.06, 14.74, 21.92, 30.67, 41.07, 53.98, 68.33, 85.85, 105.48, 109.45, 112.35, 112.47, 113.92, and 115.30 μohm cm at -200, -84, 0, 24.37, 100, 200, 300, 398, 501, 598, 700, 801, 850, 900, 925, 964, and 1000 C, respectively.

SPECIFICATION TABLE NO. 24 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
85	894	R	1964	1193-1273	1	High purity iron	2nd run of the above specimen.
86	894	R	1964	1166-1272	1	High purity iron	3rd run of the above specimen; after 2nd run, temperature raised to 1065 C and left overnight to stabilize thermocouples.
87	312	C	1963	349-926		Armco Iron	1 in. dia x 0.250 in. thick; Armco iron used as comparative material.
88	895	R	1964	373-1273			99.97 pure; disc shaped specimen 10.45 cm in dia with an axial hole 1.27 cm in dia; measured in a vacuum of 2 x 10^{-5} mm Hg.
89	477	L	1962	397-636		Armco Iron	Specimen supplied by Abeles, B.
90	321	P	1956	336-1269		Armco Iron	Thermal conductivity values calculated from the measured data of thermal diffusivity specific heat data of Darkin, L.S. and Smith, R.P., (Ind. Engr. Chem., 43, p. 1815, 1951) and the density of 7.867 g cm^{-3}.
91	916	R	1966	323-1273	±1.5	High purity iron	99.95 Fe (approx); 0.002-0.02 Si, 0.014 C, 0.00095-0.0095 Ni, 0.0088 O, <0.0056 H, 0.0052 S, 0.00021-0.0021 Al, 0.002 P, 0.002 N, 0.00014-0.0014 Ca, and 0.00009-0.0009 Cu; obtained by electron-beam melting Armco iron; electrical resistivity reported as 0.40, 1.01, 5.31, 9.04, 11.72, 14.70, 18.06, 21.84, 26.10, 30.72, 35.90, 41.51, 47.53, 54.12, 61.22, 68.89, 77.10, 86.22, 96.46, 105.53, 109.58, 112.56, 113.09, 112.54, 113.66, and 115.49 μ ohm cm at -269, -195.7, -79.1, 0, 50, 100, 150, 200, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750, 800, 850, 900, 910, 920, 950, and 1000 C, respectively.
92	1004	1966	636-1102				Pure.
93	1005	E	1927	273.2			0.125 in. dia x 10 cm long; electrical resistivity 15.8 μ ohm cm at 0 C; measured in a longitudinal magnetic field of 10000 gausses.
94	1005	E	1927	273.2			The above specimen measured in a transverse magnetic field of 4000 gausses.

6750	(~0)	(~0)	11690

REMARKS

The recommended values are for well-annealed 99.998+% pure iron with residual electrical resistivity ρ_0 = 0.0327 μΩ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.10, a = 0.37, m = 2.47, α'' = 2.05 x 10^{-4}, and β = 1.34. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 8% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or estimated.

1700	(0.330)	(19.1)	2600
1800	(0.338)	(19.5)	2780

REMARKS

The recommended values are thought to be accurate to within 3% of the true values below room temperature, 2% from room temperature to about 1000 K, and 3 to 8% from 1000 to 1600 K.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 25 THERMAL CONDUCTIVITY OF LANTHANUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 25]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	122	L	1955	2.2-36		La I	99.94 pure; Ca and Be as major impurities; polycrystalline; superconducting below 4.7 K.
2	762	L	1965	1.8-6.6		La I	99.99 nominal purity; polycrystalline rod, of f.c.c. form; 5 cm long, 0.4 cm in dia; supplied by H. Fleishman Ltd.; annealed at 600 C for 24 hrs; residual electrical resistivity ρ (4.2 K) 1.72 μohm cm; electrical resistivity ratio ρ (293 K)/ρ (4.2 K) = 32.4; specimen in superconducting state below the transition point of 6.04 K (determined magnetically); x-ray analysis showed a trace of h.c.p. phase dispersed in the f.c.c. phase.
3	762	L	1965	1.7-6.7		La I	The above specimen measured in a magnetic field of 6600 gauss; specimen in normal conducting state; Lorenz number, L_0 = 2.79 x 10^{-8} V^2 K^{-2}.
4	762	L	1965	1.8-6.6		La II	Similar to the above except annealed at 600 C for 106 hrs; residual electrical resistivity ρ (4.2K) = 1.29 μohm cm; electrical resistivity ratio ρ (293 K)/ρ (4.2 K) = 44.0; specimen in superconducting state below the transition point of 6.04 K (determined magnetically); x-ray analysis showed a trace of h.c.p. phase dispersed in the f.c.c. phase.
5	762	L	1965	1.7-7.0		La II	The above specimen measured in a magnetic field of 6600 gauss; specimen in normal conducting state; Lorenz number, L_0 = 2.83 x 10^{-8} V^2 K^{-2}.
6	811		1954	301.2	10		No details given.
7	256	C	1966	291	± 6		< 0.01 rare earth metals, ~ 0.02 base metals; polycrystalline specimen 1 cm in dia and 1.2 cm long; electrical resistivity 61 μohm cm at 291 K; data point derived by the authors from measurements by 2 different thermal comparators.
8	932, 933	L	1966	83-450	± 3 to ± 5	La 1	0.1 O, 0.01 Ce, 0.003 Fe, 0.005 Cu, 0.005 Nd, and 0.005 Pr; hexagonal polycrystalline; electron-beam refined; electrical resistivity reported as 28.5, 37.3, 46.6, 53.9, 60.6, 66.1, 69.4, and 73.1 μohm cm at 98, 151, 199, 251, 300, 351, 397, and 447 K, respectively; measured in a vacuum of 10^{-4}~10^{-5} mm Hg.

REMARKS

The recommended values are for well-annealed 99.99+% pure lanthanum with residual electrical resistivity $\rho_0 = 1.29\ \mu\Omega$ cm (characterization by ρ_0 becomes important below about 150 K). The values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu lb^{-1} ft^{-1} F^{-1}. ‡Values in parentheses are extrapolated, interpolated, or estimated.

SPECIFICATION TABLE NO. 26 THERMAL CONDUCTIVITY OF LEAD

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 26]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	48	C	1954	326-497			Specimen of 1 in. cube; cut and machined from a bar of melting-point lead supplied by NBS (sample No. 49 C); all surfaces carefully lapped; nickel used as comparative material.
2	129, 852	C	1933	273-530	3	L.S.	Bureau of Standard melting point standard lead; purity indicated by freezing point of 327.4 C; specimen 15 cm long, 2 cm in dia; melted in graphite and cast in bottom feed cast iron mold; all data referred to the value 0.352 Watt $cm^{-1}K^{-1}$ at 0 C taken from International Critical Tables, Volume II, p. 218.
3	84	P	1918	363-483			Pure, "squirted" wire, 3.1 mm in dia; thermal conductivity values calculated from measured data of thermal diffusivity and the specific heat values taken from literature.
4	95	E	1915	22-374			99.998 pure; specimen 6.24 cm long, 0.2996 cm in dia; electrical resistivity reported as 19.26 and 20.69 μohm cm at 0 and 18 C, respectively.
5	63	L	1940	2.6-23			Single crystal, pure lead obtained from Adam Hilger Ltd. (H.S. brand); melted in high vacuum; filtered through a narrow glass opening, pressed in nitrogen into a glass tube of the desired shape then cooled slowly to make a specimen of 15 cm long, 2.5 mm in dia; transition point ~7.13 K; thermal conductivity data in normal state below transition point obtained by applying a transversal magnetic field of strength 472-810 gauss.
6	63	L	1940	2.0-7.1			The above specimen in superconducting state.
7	77	E	1900	291, 273			99.95 Pb (by difference), < 0.05 total Cu, Bi, Fe, and Ni; 1.8028 cm dia x 27.0 cm long; density 11.32 g cm^{-3} at 18 C; electrical conductivity reported as 4.84 and 3.64 x 10^4 $ohm^{-1}cm^{-1}$ at 18 and 100 C, respectively.
8	77	L	1900	291, 273			Similar to the above specimen.
9	113	C	1957	623-873		Lab No. 5873	99.995+ pure, molten specimen contained in a thin-walled tube; electrical resistivity reported as 95.0, 97.2, 99.5, 102.0, 104.4, and 106.8 μohm cm at 350, 400, 450, 500, 550, and 600 C, respectively. 0.8% carbon steel used as comparative material.
10	85	L	1919	381-871			Cylindrical specimen.
11	18	L	1936	2.6-7.1			In superconducting state.
12	18	L	1936	7.9-77			No details reported.
13	117	L	1949	1.4-3.8		Pb II	High purity; single crystal; specimen 3.8 mm in dia obtained from Adam Hilger Ltd. (H.S. brand); in superconducting state.
14	117	L	1949	1.4-3.9		Pb II	The above specimen in normal state; measured in a longitudinal magnetic field of 850 oersteds.
15	117	L	1949	1.4-2.5		Pb III	Similar to the above specimen but 4.0 mm in dia; in superconducting state.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	97	L	1952	1.8-6.7	± 3	Pb I	99.998 pure; Tadanac lead; single crystal; in superconducting state.
17	97	L	1952	1.7-38	± 3	Pb I	The above specimen in normal state.
18	14	L	1940	136-887			No details reported.
19	88	L	1908	109-299			Turned from a bar of pure lead supplied by Messr. Baxendale, Manchester; density 11.29 g cm^{-3} at 25 C; electrical resistivity reported as 6.71, 9.71, 12.9, 15.7, 18.5, and 20.9 μ ohm cm at -170, -129.4, -89.2, -51.8, -14.0, and 17.4 C, respectively.
20	144	L	1952	317.2			Specimen cut from melting point standard lead supplied by NBS; 1.75 x 0.1875 x 0.1875 in.; measured in vacuo.
21	16	F	1929	37-378			No details reported.
22	257, 379	L	1958	1.1-4.6	± 2	Pb 1	99.99 pure; monocrystal; obtained from Johnson & Matthey Co. Ltd. (No. 560); specimen ~7 cm long, 3 mm in dia; annealed in vacuo for several days at a few degrees below the melting point; residual electrical resistivity 0.008 μohm cm; in superconducting state.
23	257, 379	L	1958	1.2-4.8	± 2	Pb 1	The above specimen in normal state; measured in a transversal magnetic field of 1000 gauss.
24	257	L	1958	1.0-4.6	± 2	Pb 2	99.99 pure; polycrystal; obtained from Johnson and Matthey Co. Ltd. (No. 560); grain size 0.5 mm; specimen ~7 cm long, 3 mm in dia; annealed in vacuo for several hrs at a few degrees below the melting point; residual electrical resistivity 0.008 μ ohm cm; in superconducting state.
25	257	L	1958	1.1-3.9	± 2	Pb 2	The above specimen in normal state; measured in a transversal magnetic field of 1000 gauss.
26	257	L	1958	1.1-4.6	± 2	Scroll	Pure; hollow cylindrical specimen 3 cm in dia made from lead foil 0.070 mm thick; annealed in vacuo for 5 days at a few degrees below the melting point; in superconducting state.
27	257	L	1958	1.6-4.6	± 2	Scroll	The above specimen in normal state; measured in a magnetic field of 1000 gauss.
28	257	L	1958	0.98-4.2	± 2	PbBi 0.02	99.98 Pb, 0.02 Bi, polycrystal with long crystals; specimen ~7 cm long, 3 mm in dia, annealed in vacuo for several hrs at a few degrees below the melting point; residual electrical resistivity 0.021 μohm cm; in superconducting state.
29	257	L	1958	0.98-4.3	± 2	PbBi 0.02	The above specimen in normal state; measured in a magnetic field of 1000 gauss.
30	257	L	1958	1.1-4.8	± 2	PbBi 0.1	99.899 Pb (by difference), 0.101 Bi; polycrystal; grain size 0.3 mm; specimen ~7 cm long, 3 mm in dia; annealed in vacuo for several hrs at a few degrees below the melting point; residual electrical resistivity 0.092 μohm cm; in superconducting state.
31	257	L	1958	1.0-4.4		Pb Bi 0.1	The above specimen in normal state; measured in a magnetic field of 1000 gauss.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
32	342	L	1953	2.7		Pb 1	99.998 pure; single crystal; measured in transverse magnetic fields of strength ranging from 0.70 to 3.90 kilooersteds.
33	342	L	1953	2.7		Pb 1	The above specimen measured in longitudinal magnetic fields of strength ranging from 0.87 to 3.94 kilooersteds.
34	342	L	1953	5.3		Pb 1	The above specimen measured in transverse magnetic fields of strength ranging from 1.86 to 3.94 kilooersteds.
35	342	L	1953	6.4		Pb 1	The above specimen measured in transverse magnetic fields of strength ranging from 0.52 to 3.94 kilooersteds.
36	18	L	1936	3.8-8.6			Measured in a magnetic field of 764 gauss.
37	18	L	1936	6.39			The above specimen measured in a magnetic field of 765 gauss.
38	461	L	1951	2.5			99.998 pure; 0.5 cm dia x 10 cm long, measured in transverse magnetic fields of strength ranging from 0 to 921 gauss.
39	461	L	1951	2.5			The above specimen measured in transverse magnetic fields of decreasing strength ranging from 685 to 0 gauss.
40	462	L	1952	0.40-1.2			Single crystal; in superconducting state.
41	462	L	1952	0.43			The above specimen measured in magnetic fields with increasing strength ranging from 0 to 100% of the critical magnetic field.
42	462	L	1952	0.43			The above specimen measured in magnetic fields with decreasing strength ranging from 82 to 0% of the critical magnetic field.
43	462	L	1952	0.59			The above specimen measured in magnetic fields with increasing strength ranging from 0 to 100% of the critical magnetic field.
44	462	L	1952	0.59			The above specimen measured in magnetic fields with decreasing strength ranging from 72 to 37% of the critical magnetic field.
45	462	L	1952	1.5			The above specimen measured in magnetic fields with increasing strength ranging from 0 to 86% of the critical magnetic field.
46	462	L	1952	1.5			The above specimen measured in magnetic fields with decreasing strength ranging from 69 to 0% of the critical magnetic field.
47	218	E	1956	298-437	± 3		Nominally pure; electrical conductivity reported as 4.4, 4.25, 3.6, 3.05, 2.65, and 2.45 x 10^4 $ohm^{-1}cm^{-1}$ at 37, 50, 100, 150, 200, and 230 C, respectively.
48	406	C	1922	313.2	5		Pure lead specimen 3 cm long and 3 cm in dia; zinc used as a comparative material.
49	[illegible]	E	1944	405-570			Pure; single crystal; electrical resistivity reported as 29.67, 34.01, 39.68, 42.01, and 47.16 μohm cm at 405.1, 445.1, 499.1, 521.1, and 570.1 K, respectively.

SPECIFICATION TABLE NO. 28 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
50	431	F	1944	390-540			Pure polycrystal; electrical resistivity reported as 30.1, 38.16, 42.44, and 46.88 μ ohm cm at 390.1, 461.8, 499.0, and 539.9 K, respectively.
51	463	E	1924	273-326			Pure (supposed to be Kahlbaum's); 25 cm long, cross sectional area 0.439 cm².
52	682	L	1960	0.16-1.2		I	99.999 pure; single crystal, specimen 0.13 cm in dia ~5.0 cm long; in superconducting state.
53	464	R	1917	285-310	1.2		Commercially pure (major impurity probably tin); specimen composed of 2 hollow hemispheres of 3.65 cm internal radius and 7 cm external radius.
54	465	C	1967	83-300			Pure specimen (Kahlbaum lead) 32.85 mm in dia and 7 cm long; copper used as comparative material.
55	466	L	1961	1.4-7.5		E	99.9⁺ Pb (by difference), < 0.1 metallic impurities; single crystal;enriched in isotopes of lead; specimen 1.54 cm long, 0.186 cm in dia; cast in high vacuum (10^{-5} mm Hg); annealed in vacuum for 5 hrs at 260 C; in superconducting state.
56	166	L	1961	2.9-7.3		E	The above specimen measured in a longitudinal magnetic field at 900 gauss; in normal state.
57	466	L	1961	1.5-7.7		D	99.95 Fe (by difference), 0.05 metallic impurities; specimen 2.40 cm long, 0.123 cm in dia; same fabrication method as the above specimen; in superconducting state.
58	466	L	1961	2.0-7.6		D	The above specimen measured in a longitudinal magnetic field of 900 gauss; in normal state.
59	466	L	1961	2.4-7.6		B	Similar to the above specimen but 2.26 cm long and 0.123 cm in dia; in superconducting state.
60	466	L	1961	2.4-7.3		B	The above specimen measured in a longitudinal magnetic field of 900 gauss; in normal state.
61	466	L	1961	2.4-7.7		C	Similar to the above specimen but 2.05 cm long and 0.123 cm in dia; in superconducting state.
62	466	L	1961	2.4-7.3		C	The above specimen measured in a longitudinal magnetic field of 900 gauss; in normal state.
63	389, 676	L	1958	1.0-4.4			[illegible] pure; single crystal; straight wire; annealed at 270 C for 3 days; in superconducting state.
64	389, 676	L	1958	1.0-4.0			The above specimen bent at 4.2 K and annealed at 90 K; in superconducting state.
65	389, 676	L	1958	1.1-4.4			The above specimen annealed at 290 K; in superconducting state.
66	467	C	1953	313-429	± 5	55 NI - 1	NBS melting point standard lead; inconel used as comparative material.
67	412	L	1955	0.41-1.2	± 5		99.998 pure Tadanac lead; single crystal; measured without magnetic Shielding; in superconducting state.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
68	412	L	1955	0.30-0.87	± 5		The above specimen measured with magnetic shielding; in superconducting state.
69	508, 468	L	1950	2.7-7.2			99.98 Pb (by difference), 0.02 Bi; in superconducting state.
70	508, 468	L	1950	2.5-11			The above specimen in normal state; measured in a magnetic field.
71	230	L	1925	327.2			Baker's analyzed metal: total impurities < 0.03; rod 1.9 cm in dia and 10 cm long; electrical conductivity 4.76 $ohm^{-1}cm^{-1}$ at 22 C.
72	18	L	1936	3.47			Measured in a magnetic field of 1006 gauss.
73	18	L	1936	4.4, 4.6			The above specimen measured in a magnetic field of 956 gauss.
74	506	C	1953	322-414		55 M - 1	NBS melt point standard lead; specimen 0.350 in. in dia and 0.510 in. long; copper used as the comparative material.
75	506	C	1953	319-419		55 P - 1	Similar to the above specimen but 0.450 in. in dia and 0.509 in. long.
76	506	C	1953	319-385		55 J - 1	Similar to the above specimen but 0.250 in. in dia and 0.265 in. long.
77	506	C	1953	321-416		55 K - 1	Similar to the above specimen but 0.250 in. in dia and 0.528 in. long.
78	506	C	1953	316-398		55 L - 1	Similar to the above specimen but 0.300 in. in dia and 0.502 in. long.
79	506	C	1953	319-400		55 N - 1	Similar to the above specimen but 0.410 in. in dia and 0.489 in. long.
80	506	C	1953	316-436		55 N - 2	Similar to the above specimen but 0.410 in. in dia and 0.487 in. long.
81	506	C	1953	322-401		55 Q - 1	Similar to the above specimen but 0.500 in. in dia and 0.500 in. long.
82	506	C	1953	314-405		55 Q - 2	Similar to the above specimen but 0.500 in. in dia and 0.476 in. long.
83	96, 468	L	1950	2.6-9.4			99.9 Pb, 0.1 Bi; in normal state; measured in a magnetic field.
84	96, 468	L	1950	2.7-6.4			The above specimen in superconducting state.
85	509	C	1954	314-381	± 3	55 B - 1	Accurately ground specimen 0.500 ± 0.001 in. in dia and 0.500 ± 0.005 in. long; electrolytic deposited pure copper used as a comparative material; reference data of copper taken from International Critical Tables, Vol. 5, McGraw-Hill, p. 221, 1929.
86	509	C	1954	324-401	± 3	55 B - 2	Second run of the above specimen.
87	509	C	1954	314-414	± 3	55 B - 3	Third run of the above specimen.
88	735, 839	P	1955	850-1250	6-8		Molten specimen in a tantalum crucible made from 2 coaxial tubes with dia of 23.8 and 8 mm, each tube 0.12 mm thick; data calculated from measured data of thermal diffusivity and specific heat, and values of density taken from Slavinskii, M.P. [Physicochemical Properties of elements (in Russian), 1952].
89	510	L	1956	373-473		H	99.997[+] pure electrolytic lead; specimen 20 mm in dia and 40 mm long.
90	510	L	1956	328-523		B	Similar to the above specimen.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
91	510	L	1956	328-523		P	Rectangular specimen of the same purity as the above specimen; size 22 x 22 x 40 mm.
92	510	L	1556	380-510		A	Similar to the above specimen but 20 mm in dia and 50 mm long.
93	510	L	1956	373-473		L	Similar to the above specimen but only 40 mm long.
94	511	L	1918	298.0			Specimen radius 0.675 cm; furnished by "Erba".
95	619	L	1916	20-273			Lead (technical) specimen 0.5 cm in dia and 5 cm long; electrical conductivity reported as 173.57 and 5.09 x 10^4 $ohm^{-1}cm^{-1}$ at 20.4 and 273 K, respectively.
96	619	L	1916	21-273			Pure Kahlbaum lead specimen 0.5 cm in dia and 5 cm long.
97	592	L	1959	700-1130			In liquid state; melting point 327.4 C; measured in a vacuum of 5 x 10^{-4} mm Hg.
98	702	E	1961	293-347	1		99.99 pure; size 0.184 x 2 x 6 in.; specimen cut from a prefabricated sheet.
99	703	C	1955	319-411			NBS melting point standard lead; data obtained by using 28 gauge iron-constantan thermocouples with OFHC copper used as comparative material.
100	703	C	1955	328-405			The above specimen measured by using 30 gauge copper-constantan thermocouples.
101	703	C	1955	317-376			The above specimen measured by using 24 gauge copper-constantan thermocouples.
102	706	L	1881	273,373			23.7 cm long; electrical conductivity reported as 5.141 and 3.602 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively. (The author reported as 5.141 and 3.602 x 10^5 ohm^{-1} cm^{-1}, obviously a typographical error.)
103	237	L	1950	2.7			99.998 pure (by difference), impurity < 0.002; cylindrical specimen prepared from Johnson Matthey H.S. lead; measured in longitudinal magnetic fields of increasing strength ranging from 0 to 1000 gauss.
104	237	L	1950	2.7			The above specimen measured in magnetic fields of decreasing strength ranging from 1000 to 0 gauss.
105	237	L	1950	4.6			The above specimen measured in magnetic fields of increasing strength ranging from 0 to 1000 gauss.
106	237	L	1950	4.6			The above specimen measured in magnetic fields of decreasing strength ranging from 610 to 33 gauss.
107	237	L	1950	5.29			About 99.98 Pb (by difference), 0.02 Bi; cylindrical specimen prepared from Johnson Matthey H.S. lead (impurity <0.002%); measured in longitudinal magnetic fields of increasing strength 0 to 1000 gauss.
108	237	L	1950	5.29			The above specimen measured in longitudinal magnetic fields of decreasing strength ranging from 1000 to 45 gauss.
109	237	L	1950	5.40			The above specimen measured in transverse magnetic fields of increasing strength ranging from 0 to 1000 gauss.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
110	237	L	1950	5.40			The above specimen measured in transverse magnetic fields of decreasing strength ranging from 996 to 0 gauss.
111	237	L	1950	2.89			The above specimen measured in transverse magnetic fields of increasing strength ranging from 0 to 1000 gauss.
112	237	L	1950	2.89			The above specimen measured in transverse magnetic fields of decreasing strength ranging from 1000 to 0 gauss.
113	237	L	1950	2.92			The above specimen measured in longitudinal magnetic fields of increasing strength ranging from 0 to 1000 gauss.
114	237	L	1950	2.92			The above specimen measured in longitudinal magnetic fields of decreasing strength ranging from 1000 to 0 gauss.
115	237	L	1950	2.6-21			The above specimen measured in a magnetic field greater than the critical field; in normal state.
116	237	L	1950	2.8-7.2			The above specimen measured before applying the magnetic field; in superconducting state.
117	237	L	1950	2.7-3.9			The above specimen measured after applying the magnetic field; in superconducting state.
118	693, 729	L	1963	7.2-8.3			Lead specimen grade 69 of the Consolidated Mining and Smelting Co.; single crystal; 0.25 in. in dia and 3 in. long; zone refined.
119	693, 729	L	1963	6.4-8.3			The above specimen measured in a magnetic field of 600 gauss; in normal state; data corrected to zero field.
120	693, 729	L	1963	6.3-8.3			The above specimen measured in a magnetic field of 680 gauss; in normal state; data corrected to zero field.
121	693, 729	L	1963	6.2-7.3			The above specimen measured in a magnetic field at 800 gauss; in normal state; data corrected to zero field.
122	693, 729	L	1963	5.5-7.2			The above specimen in superconducting state.
123	730	L	1945	291-333	> 2	NBS sample 49b	Calibration specimen for freezing point determination.
124	730	L	1945	302-330	> 2	NBS sample 49b	The above specimen remeasured with a slightly different method of balancing thermocouples to avoid radial heat losses.
125	707	C	1953	617-755			0.10 Foreign non-volatile matter, < 0.001 Ag, and < 0.001 other foreign metals; in molten state; produced by Mallinckrodt Chemical Works; test cylinder 3 in. in dia; Armco iron used as comparative material; data taken from smoothed curve, corrected for the effect of transients.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
126	731	L	1952	0.13-0.29			99.998+ pure; provided by Johnson Matthey & Co. Ltd., London, (Batch No. 3620); specimen size 8 x 2.1 x 25 mm; warm up number 1; in superconducting state.
127	731	L	1952	0.18-0.36			The above specimen, warm up number 2.
128	731	L	1952	0.19-0.38			The above specimen, warm up number 3.
129	732	L	1965	0.015-0.23			99.999 pure (nominal); supplied by Koch-Light Laboratories Ltd. (Colnbrook, England); wire 5 cm long and 0.5 mm in dia; measured in a longitudinal magnetic field of 1000 gauss; in normal state.
130	733	L	1962	0.11-0.41			99.999 pure; polycrystalline; material obtained from Central Research Laboratories, American Smelting and Refining Co.; ratio of specimen cross sectional area to length 3.47 x 10^{-3} cm; cut and rolled from a lead bar of the mentioned purity; annealed at room temperature for many weeks; measured in a longitudinal magnetic field of 900 gauss; in normal state.
131	733	L	1962	0.20-0.33			The above specimen measured in a transverse magnetic field of 3000 gauss.
132	733	L	1962	0.42			The above specimen measured in a transverse magnetic field of 2000 gauss.
133	733	L	1962	0.14-0.41			The above specimen measured in a transverse magnetic field of 1000 gauss.
134	734	R	1926	323.2			Specimen in the form of a long hollow cylinder.
135	744	P	1966	560-1355	7-8		Molten lead filled the space between two coaxial thin-walled tubes of tantalum of 24 and 8 mm dia, respectively; thermal conductivity values calculated from measured data of thermal diffusivity and specific heat.
136	838	C	1967	474-870			Molten specimen placed in a hole 21 mm in dia drilled in an asbestos cement cylinder 30 mm in height; 1Kh18N9T steel used as comparative material.
137	840	L	1966	223-573	< 1		Lead specimen cut from bar of 99.999 pure or better; supplied by Dept. of Mines and Technical Surveys, Ottawa; smoothed values (experimental point deviations less than 1.5%).
138	840	L	1966	223-573	< 1		Lead specimen cut from the same bar as above and measured by another apparatus with modifications of the thermal shielding.
139	841	L	1967	335-602	13		99.995+ Pb, 0.001 Cd, 0.0005 Ag, 0.0005 Cu, and 0.0003 Bi; 7 mm dia x 15 cm long; supplied by Johnson Matthey & Co.; electrical resistivity reported as 19.3, 23.4, 27.5, 31.8, 36.3, 40.8, and 45.7 μohm at 0, 50, 100, 150, 200, 250, and 300 C, respectively.
140	842	C	1967	316-420		Pyrometric standard lead 49 c	0.03 Bi, 0.002 Ag, 0.002 Cd, 0.001 Fe, 0.001 Ni, 0.001 Si, 0.001 Te, 0.0005 Cu, 0.0005 Sn, and 0.0001 Mg; electrical resistivity reported as 0.394, 0.735, 4.84, and 21.31 μohm cm at 20, 25, 77, and 298 K, respectively; M. P. 327.3 C; Armco iron used as comparative material.

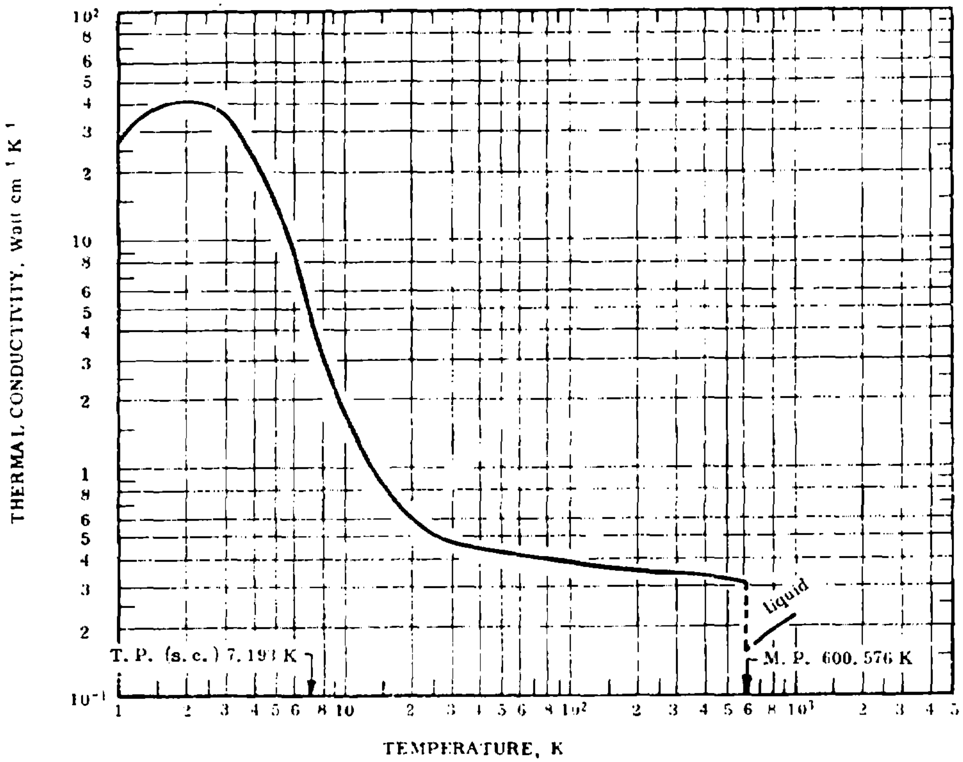
FIGURE AND TABLE NO. 26R RECOMMENDED THERMAL CONDUCTIVITY OF LEAD



REMARKS

The recommended values are for well-annealed 99.99⁺% pure lead with residual electrical resistivity $\rho_0 = 0.000880\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 80 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 3.00, $\alpha' = 7.40 \times 10^{-4}$, and $\beta = 0.0353$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 10% at other temperatures.

SPECIFICATION TABLE NO. 27 THERMAL CONDUCTIVITY OF LITHIUM

[For Data Reported in Figure and Table No. 27]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	12	F	1926	23-423			Pure; 1.10 cm dia and 25 cm long; extruded; electrical conductivity reported as 1050, 135, 37.8, 36.1, 26.9, 21.1, 17.5, 15.00, 12.85, 11.55, 10.35, 9.44, 8.70, 8.13, 7.57, and 7.14 x 10^4 ohm^{-1} cm^{-1} at 23, 73, 98, 123, 148, 173, 198, 223, 248, 273, 293, 323, 318, 373, 398, and 423 K, respectively.
2	52	L	1956	2.2-121		Li 2	High purity; 1.4 mm dia, supplied by A. D. Mac Kay (New York); extruded; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 254 (using Gunty and Broniewski's value ρ(295 K) 9.44 μ ohm cm).
3	99	L	1954	2.0-74		Li 3	High purity; 1.4 mm dia; supplied by New Metals and Chemical Ltd (London); ρ(295 K)/ρ(0 K) = 137 (using Gunty and Broniewski's value ρ(295 K) = 9.44 μohm cm).
4	142	C	1953	499-812	10		99.8 Li, 0.005 Cl, 0.07 N, 0.09 heavy metals, 0.02 Na, 0.06 Ca, 0.03 Fe and Al, 0.015 Si; specimen in liquid state; supplied by Maywood Chemical Works; 1.999 in. dia. Armco iron used as comparative material.
5	223	L	1956	1.9-96		Li 1	High purity; possibly contaminated with Cu; 0.93 mm dia; distilled; electrical resistivity 8.98 μ ohm cm at room temperature and 0.084 μ ohm cm at 0 K; electrical resistivity ratio ρ(room temp)/ρ(0 K) = 100.
6	223	L	1956	2.6-95		Li 2	Similar to the above specimen but no Cu contamination; electrical resistivity 9.17 μ ohm cm at room temperature and 0.0485 μ ohm cm at 0 K; ρ(room temp)/ρ(0 K) = 200.
7	243	L	1950	543-652	10		Composition before test: 99.52$^+$ Li (by difference), 0.1 Ca, 0.1 Si, < 0.1 Hg, < 0.1 P, < 0.01 Al, < 0.01 B, < 0.01 Cr, < 0.01 Cu, < 0.01 Fe, < 0.01 K, < 0.01 Na, and < 0.01 Ni; after test: 99.22$^+$ Li (by difference), 0.1 Ca, < 0.1 Hg, < 0.1 P, 0.1 Al, 0.2 B, 0.02 Cr, 0.04 Cu, < 0.01 K, < 0.1 Na and < 0.01 Ni; specimen in liquid state; 0.684 in. dia. supplied by Maywood Chemical Company; M.P. 186 C.
8	595, 452	-	1961	467-1128			(Nominal specification): 99.9 Li (min), 0.03 Na, 0.01 K, 0.01 Ca, 0.002 Cl, 0.01 N, 0.005 Fe, 0.01 Ni, and 0.002 Cr; posttest 0.04 Na, 0.23 N, 0.012 Fe, 0.004 Ni, and 0.013 Cr; specimen in liquid state; 0.59 in. dia; electrical resistivity reported as 25.6, 25.8, 29.7, 33.1, 35.9, 38.5, 41.2, 42.5, and 43.8 μohm cm at 193.6, 199.2, 309.4, 422.2, 535.6, 644.4, 753.6, 808.3, and 864.4 C, respectively; data calculated from Wiedemann Franz-Lorenz relationship using L = 2.16 x 10^{-8} V^{2}K^{-2}, this value being based on unpublished thermal conductivity values of 0.416, 0.428, and 0.496 at 283.3 362.8 and 522.8 C that had been obtained from C. T. Ewing of the Naval Research Laboratory, Washington.
9	919, 592	L	1959	511-1012			M.P. 186 C; data in liquid state; measured in vacuum (~4 x 10^{-4} mm Hg).
10	764, 763, 471	C	1964	596-1052	± 4 - 15		Composition before test: 99.82 Li (by difference), 0.015 Na, 0.06 K, 0.0001 Ca, 0.0005 Al, 0.001 Si, 0.04 Cl, 0.012 N, < 0.0015 Ni, < 0.0015 Cr, < 0.0010 Ti, 0.0062 N, 0.0003 O, 0.0027 Fe, and 0.025 others; after test: values assumed to remain the same except 0.0058 Si, 0.0022 Ni, < 0.001 Cr, < 0.003 Mn, and 0.0024 Fe; 99.81 Li (by difference), specimen in liquid state; supplied by the Foote Mineral Company; measured in vacuum (3 x 10^{-5} mm Hg); type 347 stainless steel used as comparative material; data calculated by comparing to the top reference material (between heater and specimen).

SPECIFICATION TABLE NO. 27 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
11	764, 767, 871	C	1965	631-1100	- 5 - 15		Data of the above specimen calculated by comparing with the bottom reference material (Armco iron, between specimen and heat sink).
12	459, 460	-	1965	461-1366			Density reported as 0.4992, 0.4898, 0.4724, 0.4654, 0.4581, 0.4440, and 0.4289 g cm^{-3} at 615.8, 714.3, 862.7, 940.4, 1054, 1157 and 1311 K, respectively; electrical resistivity reported as 12.16, 13.36, 14.73, 15.54, 26.54, 28.30, 30.39, 31.02, 32.10, 33.40, 34.90, 35.99, 37.53, 38.61, 39.97, 41.53, 42.68, 46.05, 48.21, 48.96, and 49.67 μ ohm cm at 360, 394, 432, 451, 487, 536, 597, 604, 655, 696, 764, 815, 878, 918, 940, 1045, 1104, 1246, 1319, 1342, and 1372 K, respectively; thermal conductivity data calculated from measured electrical resistivity values and the Lorenz number 2.45 x 10^{-8} V^2K^{-2}.
13	969	-	1965	589-1723			0.0490 O, 0.0130 Na, < 0.0010 Fe, < 0.0010 Ni, < 0.0010 N, < 0.0005 Nb, and < 0.0005 Zr; posttest impurities 0.24 O, < 0.01 Fe, < 0.01 Nb, < 0.0030 N, < 0.0010 Ni, < 0.0010 Zr, and < 0.0002 C; molten specimen contained in a Nb-1Zr alloy capsule; electrical resistivity reported as 27.2, 29.9, 32.7, 35.4, 38.1, 40.8, 43.5, 46.1, 48.6, 51.2, 53.7, 56.1, and 59.1 μ ohm cm at 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, and 1430 C, respectively; data calculated from the measured electrical resistivity data and the Lorenz number 2.29 x 10^{-8} V^2K^{-2}, this value being based on measured thermal conductivity data of Cooke, J.W. (J. Chem. Phys., 40 (7), 1902-9, 1964).

REMARKS

The recommended values are for high-purity lithium with residual electrical resistivity $\rho_0 = 0.0371\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, $\alpha' = 1.57 \times 10^{-4}$, and $\beta = 1.52$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

*T_1 in K, k_1 in Watt $cm^{-1}K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1}ft^{-1}F^{-1}$.

‡Values in parentheses are extrapolated or estimated.

REMARKS

The recommended values are for well-annealed 99.96⁺% pure lutetium with residual electrical resistivity ρ_0 = 0.8 and 2.7 $\mu\Omega$ cm respectively in the direction parallel and perpendicular to the c-axis (characterization by ρ_0 becomes important at temperatures below about 200 K). The recommended values that are supported by experimental data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 29 THERMAL CONDUCTIVITY OF MAGNESIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 29]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	850, 93	L	1929	80-460	3.0-4.0		Extremely pure; 3 cm x 1.23 cm²; electrical resistivity reported as 0.32, 3.91, 5.56, and 7.27 μ ohm cm at 80, 273, 373, and 460 K, respectively.
2	53	E	1927	373-423	1.0		Commercially pure.
3	127	L	1925	430-729			99.6 pure; 0.75 in. rod; obtained from Magnesium Co., Ltd.; extruded, then annealed for 6 hrs at 360 C; density (at 21 C) 1.75 g cm⁻³; electrical resistivity reported as 4.59, 6.19, 8.13, 10.35, 11.13, and 13.74 μohm cm at 20.0, 101.2, 199.4, 314.0, 348.3, and 480.1 C, respectively.
4	97	L	1952	2.6-47	2.0-3.0	JM 1703; Mg 1	99.95 pure; polycrystalline; 1-2 mm dia x 5 cm long; obtained from Johnson-Matthey.
5	121	L	1954	2.5-35	1.0	JM 1703; Mg 2	99.95⁺ Mg, 0.03 Mn, 0.0075 Fe, and 0.004 Al; 15 mm dia specimen made from Johnson Matthey standardized rod; annealed in vacuo at 500 C for 6 hrs.
6	137	L	1957	1.5-24	1.0	Mg (Mn)	99.95⁺ Mg, 0.043 Mn, 0.0048 Zn, 0.0012 Ca, 0.0011 Pb, 0.0011 Sn, 0.0010 Fe, 0.001 Si, 0.0002 Al, 0.0001 Cu, and 0.0001 Ni; polycrystalline; 3.2 mm dia x 9 cm long; prepared by Dow Chemical Co.; annealed; electrical resistivity reported as 0.1479, 0.1270, 0.1196, 0.1187, and 0.1217 μohm cm at 1, 5, 10, 14.5, and 20 K, respectively.
7	137	L	1957	1.6-22	1.0	Mg (Fe)	99.98⁺ Mg, 0.013 Fe, 0.0023 Mn, 0.0013 Pb, traces of Al, Ca, Cu, Si, Ag, and Na; polycrystalline; 3.2 mm dia x 9 cm long; prepared from a Johnson Matthey spectrographic rod; electrical resistivity reported as 0.06624, 0.06458, 0.0655, 0.0679, and 0.0727 μohm cm at 1, 5, 10, 15, and 20 K, respectively.
8	275	L	1953	2.5-91	0.5-1.0	JM 1348; Mg 1	99.98⁺ Mg, 0.013 Fe, 0.0023 Mn, 0.0013 Pb, traces of Ca, Cu, Si, Ag, and Na; 3 mm dia rod drawn by Johnson-Matthey from a sample JM 1848.
9	275	L	1953	2.5-149	0.5-1.0	JM 1848; Mg 2	The above specimen annealed in vacuo for 3 hrs at 350 C.
10	275	L	1953	2.2-27	0.5-1.0	JM 1848; Mg 3	Similar to the above specimen Mg 2.
11	225	L	1928	373-623			0.031 Si, 0.012 Cu, and 0.014 total Fe and Al; 1 in. dia x 12 in. long; annealed for 5 hrs at 530 C before machining.
12	408	E	1925	302.2	< 0.5	Mg	0.175 Si, 0.052 Al, and 0.014 Fe; 3 mm dia x 20 cm long; chill-cast; electrical resistivity 4.52 μohm cm at 29 C.
13	408	E	1925	301.2	< 0.5	Mg	The above specimen annealed for 30 min at 450 C; electrical resistivity 4.42 μ ohm cm at 29 C.
14	295		1952	493, 553			Extruded powder specimen; density 98-100% of theoretical value.
15	673	E	1932	291.3	± 1.3		Pure; electrical conductivity 2.31 x 10⁵ ohm⁻¹cm⁻¹ at 18.1 C.
16	674	L, C	1964	323-673		Mg 1	99.95 Mg, 0.033 Al, and 0.012 Zn; 1.9 cm in dia and 30 cm long; supplied by the Metallurgy Division of the National Physical Laboratory; forged and stabilising heat treated; electrical resistivity reported as 4.5, 5.01, 5.85, 7.57, 9.30, and 11.04 μohm cm at 293, 323, 373, 473, 573, and 673 K, respectively.

SPECIFICATION TABLE NO. 29 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
17	674	L, C	1964	323-423		Mg II	99.98 Mg, 0.017 Al, and 0.004 Zn; 0.635 cm in dia and 10 cm long; supplied by Messrs. Johnson, Matthey & Co., Ltd.; electrical resistivity reported as 4.34, 4.85, 5.70, and 6.51 μ ohm cm at 293, 323, 373, and 423 K, respectively.
18	706	L	1881	273,373			Electrical conductivity reported as 24.47 and 17.5 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
19	719	P	1965	293.2			Spectroscopically pure; specimen 1.27 cm long; thermal conductivity values calculated from measured thermal diffusivity data.
20	719	P	1965	293.2			Similar to the above specimen but 0.635 cm long.
21	722	L	1963	307-324			Specimen 4.025 in. in dia and 1.015 in. thick.
22	721	L	1953	1.0-4.7		Sample # 765	99.98+ Mg, 0.01 Mn, 0.003 Zn, 0.0012 Pb, 0.001 Ca, <0.001 Si, <0.001 Sn, 0.0008 Fe, 0.0002 Al, < 0.0001 Cu, and < 0.0001 Ni; specimen 9.03 cm long and 0.319 cm in dia; electrical resistivity reported as 0.048, 0.042, 0.04, 0.037, 0.04, 0.042, 0.047, and 0.058 μ ohm cm at 1.0, 3.0, 5.0, 10.0, 15.0, 20.0, 25.0, and 30 K, respectively.
23	721	L	1953	1.1-4.4		Sample # 767	99.95 Mg, 0.043 Mn, 0.0048 Zn, 0.0012 Ca, 0.0011 Pb, 0.0011 Sn, 0.0010 Fe, < 0.001 Si, 0.0002 Al, < 0.0001 Cu, and < 0.0001 Ni; specimen 8.93 cm long and 0.307 cm in dia; electrical resistivity reported as 0.153, 0.144, 0.136, 0.123, 0.120, 0.127, and 0.137 μ ohm cm at 1.0, 3.0, 5.0, 10, 15, 20, and 25 K, respectively.
24	721	L	1953	1.0-4.5		Sample # 370	99.87+ Mg, 0.12 Mn, 0.0036 Zn, 0.0014 Pb, 0.0011 Fe, <0.001 Si, < 0.001 Sn, 0.0006 Ca, 0.0002 Al, < 0.0002 Ni, and 0.0001 Cu; specimen 9.35 cm long and 0.305 cm in dia; electrical resistivity reported as 0.365, 0.34, 0.32, 0.29, 0.275, 0.30, and 0.37 μ ohm cm at 1.0, 3.0, 5.0, 10, 20, 30, and 40 K, respectively.
25	843	P	1966	298.2			Spherical grains supplied by Valley Metallurgical Processing Co.; specimen contained in a 0.75 in. dia x 2 in. long cylindrical cell; mesh size -100 + 200; thermal conductivity measured by the transient line source method; measured in Freon - 12 under a pressure of ~100 psig.
26	843	P	1966	298.2			Similar to above; measured in argon under a pressure of ~100 psig.
27	843	P	1966	298.2			Similar to above; measured in nitrogen under a pressure of ~100 psig.
28	843	P	1966	298.2			Similar to above; measured in methane under a pressure of ~100 psig.
29	843	P	1966	298.2			Similar to above; measured in helium under a pressure of ~100 psig.
30	843	P	1966	298.2			Similar to above; measured in hydrogen under a pressure of ~100 psig.

REMARKS

The recommended values for well-annealed 99.98$^+$% pure magnesium with residual electrical resistivity ρ_0 = 0.0189 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, α' = 0.83 x 10^{-4}, and β = 0.772. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated.

THERMAL CONDUCTIVITY OF MANGANESE

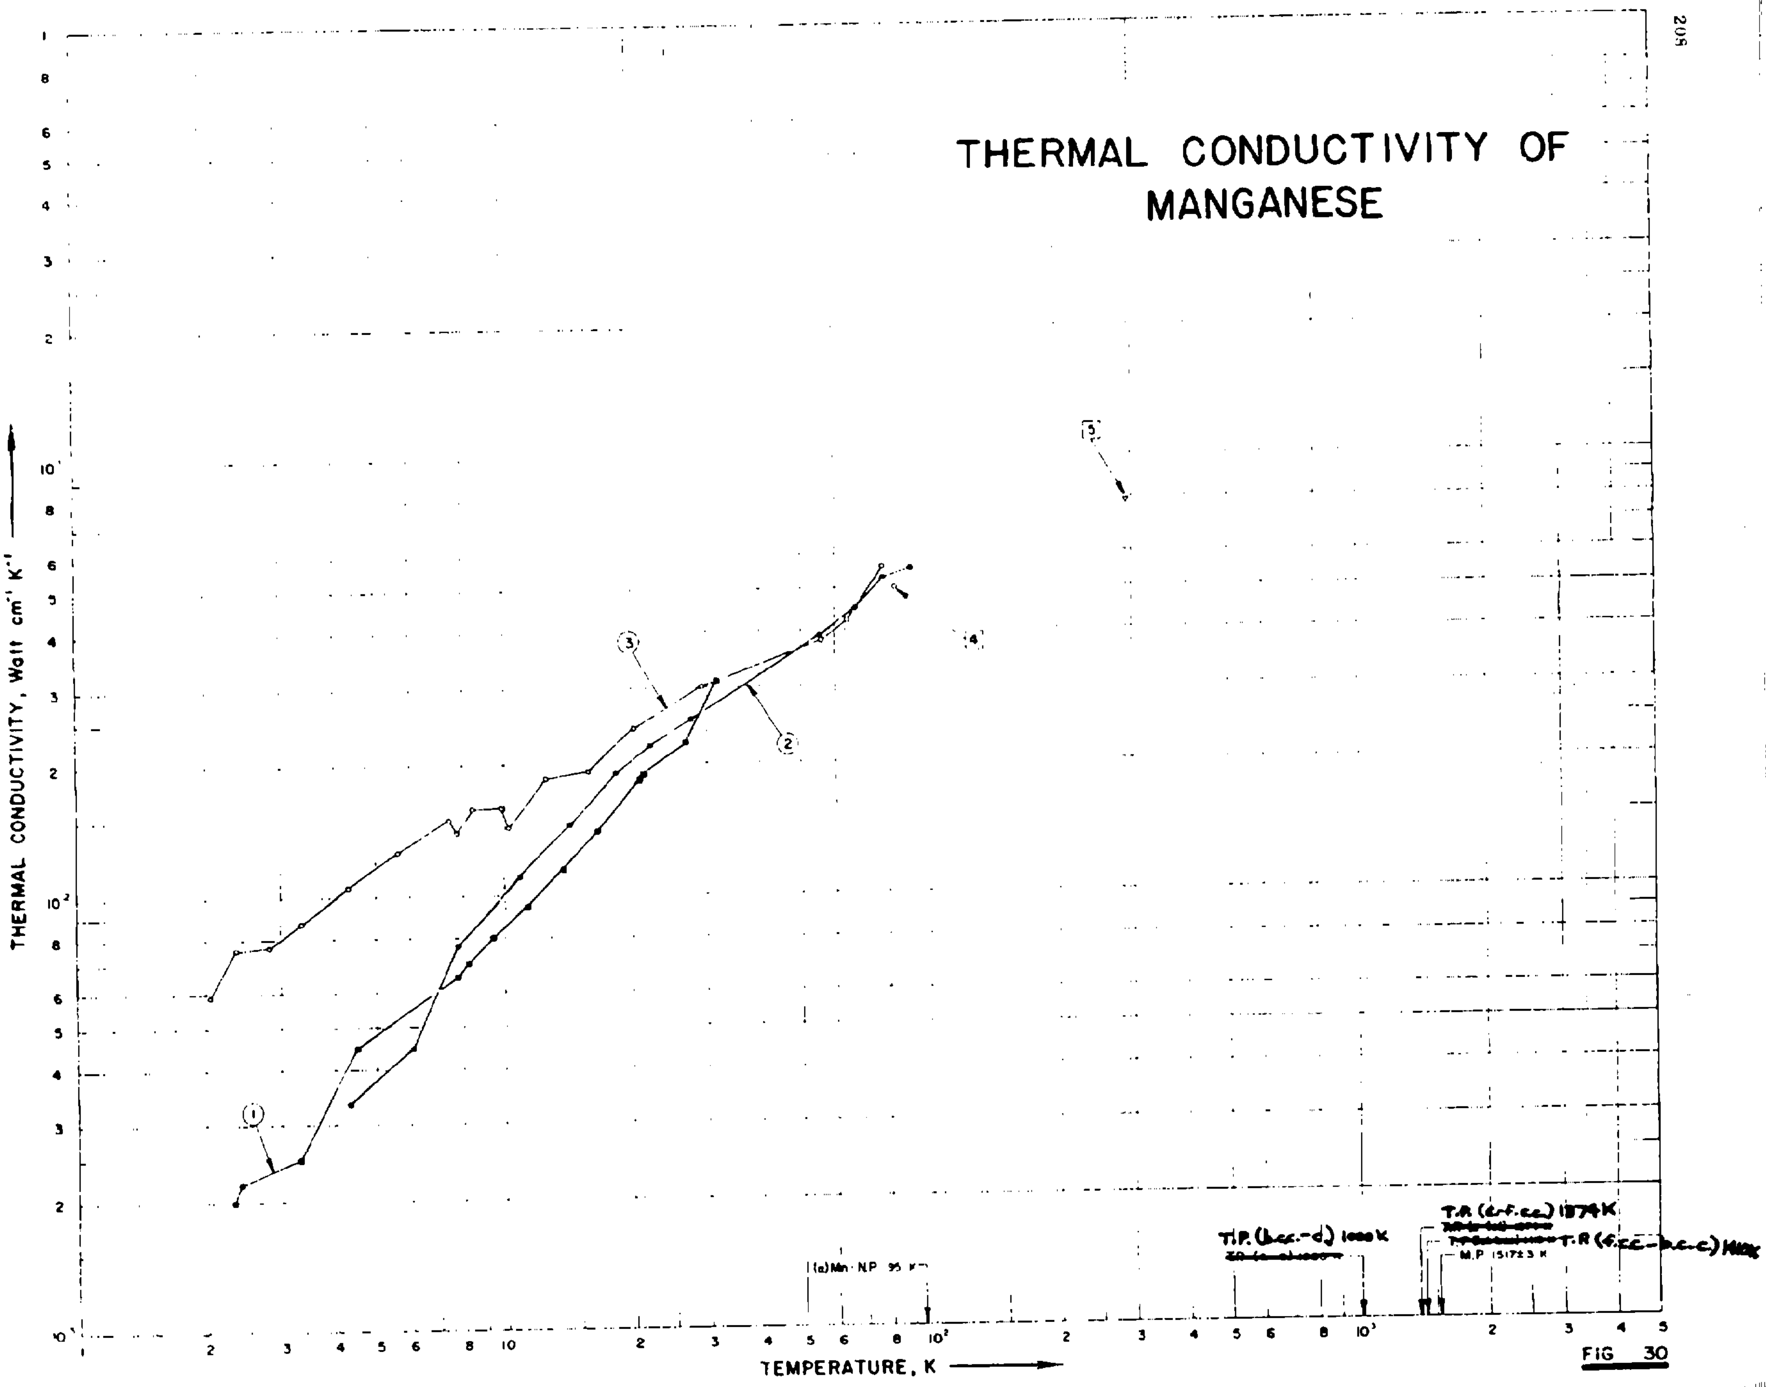

FIG 30

SPECIFICATION TABLE NO. 30 THERMAL CONDUCTIVITY OF MANGANESE

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 30]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	97	L	1952	2.3-32	2-3	JM 2472; Mn 1	99.99 pure; polycrystalline; supplied by Johnson Matthey and Co. Ltd.; annealed; electrical resistivity ratio $\rho(273K)/\rho(20K)$ = 1.47.
2	372	L	1957	4.3-9.		Mn 2	99.99 Mn, 0.001 Mg; α - manganese, cross section 3 x 1.1 mm; JM 10792 from Johnson, Matthey Co. Ltd.; electrical resistivity reported as 330 and 378 μ ohm cm at 4.2 K and room temperature, respectively.
3	372	L	1957	2.1-78		Mn 3	Similar to the above specimen except annealed in vacuum at 600 C; electrical resistivity 150 μ ohm cm at room temperature; residual electrical resistivity 11.3 μ ohm cm.
4	697	L	1935	83.2			β - manganese; approx 16 mm long, 5 mm dia; electrical resistivity 110 μ ohm cm at -190 C.
5	255	C	1966	293		JM 810	Pure α - manganese with impurities Mg, Ca, and < 0.01 S; some gaseous impurity expected; specimen a small irregular-shaped flake ~0.1 cm thick from Johnson Matthey and Co. Ltd.; electrolytically prepared; high-alloy steel, titanium alloy, and an alumina based ceramic used as reference materials.

REMARKS

The recommended values are for well-annealed 99.99% pure manganese with residual electrical resistivity ρ_0 = 11.3 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or interpolated.

SPECIFICATION TABLE NO. 31 THERMAL CONDUCTIVITY OF MERCURY

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 31]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	50	L	1919	80-423			Pure; specimen filled in an iron cylinder; electrical conductivity reported as 13.77, 7.292, 5.327, 4.287, 1.070, and 1.055 x 10^4 $ohm^{-1}cm^{-1}$ at -193, -115, -75.1, -44.7, -37, and -20.5 C, respectively.
2	143	L	1957	1.5-4.1		Hg 3	99.9 Hg, 0.05 Cu, 0.05 Ag, and trace of other base elements; polycrystalline; commercially available cp reagent from Eimer and Amend, Cat. No. M-141; in superconducting state.
3	143	L	1957	1.4-3.5		Hg 3	The above specimen measured in a transverse magnetic field of 859 gauss; in normal state.
4	143	L	1957	1.4-4.4		Hg 3	The above specimen measured in a transverse magnetic field of 491 gauss; in normal state.
5	59	L	1936	2.5-4.1			High purity; specimen contained in an U-shaped tube; in superconducting state.
6	59	L	1936	2.5-4.1			The above specimen measured in a magnetic field of 436 gauss; in normal state.
7	316,65	L	1936	318-492			Pure, specimen contained in a 4.9 cm dia asbestos cylinder.
8	74	L	1950	2.3-4.4		Hg 1	99.99+ pure; in normal state.
9	74	L	1950	2.3-4.2		Hg 1	99.99+ pure; in superconducting state.
10	74	L	1950	1.6-2.1		Hg 2	0.002 Cd; in normal state.
11	74	L	1950	1.6-2.2		Hg 2	0.002 Cd; in superconducting state.
12	74	L	1950	1.8-4.2		Hg 3	0.007 Cd; in normal state.
13	74	L	1950	1.8-4.0		Hg 3	0.007 Cd; in superconducting state.
14	74	L	1950	1.6-4.3		Hg 6	0.10 In; in normal state.
15	74	L	1950	1.6-4.1		Hg 6	0.10 In; in superconducting state.
16	657	P	1926	298			Liquid specimen contained in a cylindrical tube of 4 cm dia and 20 cm long; thermal conductivity value calculated from measured thermal diffusivity.
17	265	L	1955	426-810	1.4		99.999+ Hg, 0.0001-0.001 Mg; chemical analysis after experiment showed 0.0004 Fe, 0.0002 Cr, and 0.0001 Ni; Lorentz function reported as 2.64, 2.59, 2.61, 2.63, and 2.64 x 10^{-8} V^2K^{-2} at 100, 184, 256, 288, and 297 C, respectively.
18	258	L	1903	303-308			Pure, specimen filled in a container of cross sectional area 315 cm^2 and thickness 0.955 cm.
19	143	L	1957	1.4-4.2		Hg 3	99.9 Hg, 0.05 Cu, 0.05 Ag, and trace of other base elements; commercially available cp reagent from Eimer and Amend, Cat. No. M-141; measured in a magnetic field of 737 gauss; in normal state.
20	143	L	1957	3.1		Hg 1	99.99+ Hg, 0.005 Ag, and trace Cu; commercially available cp reagent from Eimer and Amend, Cat. No. M-141; measured in transverse magnetic fields with strength H ranging from 8.4 to 190 gauss; in superconducting state.
21	143	L	1957	3.1		Hg 1	The above specimen measured in transverse magnetic fields with strength H ranging from 247 to 974 gauss; in normal state.

SPECIFICATION TABLE NO. 31 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
22	143	L	1957	3.1		Hg 1	The above specimen measured in longitudinal magnetic fields with strength H ranging from 139 to 198 gauss; in superconducting state.
23	143	L	1957	3.1		Hg 1	The above specimen measured in longitudinal magnetic fields with strength H ranging from 284 to 727 gauss; in normal state.
24	143	L	1957	1.1		Hg 2	99.995% Hg, trace Ag; commercially available cp reagent from Eimer and Amend, Cat. No. M-141; measured in transverse magnetic fields with strength H ranging from 455 to 965 gauss; in normal state.
25	143	L	1957	1.8		Hg 2	The above specimen measured in transverse magnetic fields with strength H ranging from 460 to 1000 gauss; in normal state.
26	143	L	1957	1.67		Hg 2	The above specimen measured in longitudinal magnetic fields with strength H ranging from 455 to 965 gauss; in normal state.
27	143	L	1957	1.98		Hg 2	The above specimen measured in longitudinal magnetic fields with strength H ranging from 440 to 943 gauss; in normal state.
28	254	L	1932	196.2		7	Single crystal; the angle between principal crystallographic axis and rod axis θ = 21°, grown in a glass tube; electrical resistivity 15.15 μohm cm at 196.2 K.
29	254	L	1932	196.4		22	Similar to above but θ = 90° and electrical resistivity 19.30 μohm cm at 196.4 K.
30	254	L	1932	196.8		23	Similar to above but θ = 0° and electrical resistivity 14.58 μohm cm at 196.9 K.
31	254	L	1932	197.5		26	Similar to above but θ = 28° and electrical resistivity 15.72 μohm cm at 197.5 K.
32	254	L	1932	197.6		27	Similar to above but θ = 46° and electrical resistivity 17.15 μohm cm at 197.6 K.
33	254	L	1932	197.1		28	Similar to above but θ = 38° and electrical resistivity 16.41 μohm cm at 197.2 K.
34	254	L	1932	198.4		29	Similar to above but θ = 6° and electrical resistivity 14.74 μohm cm at 198.4 K.
35	254	L	1932	197.3		30	Similar to above but θ = 0° and electrical resistivity 14.63 μohm cm at 197.3 K.
36	254	L	1932	85.2		3	Similar to above but θ = 25° and electrical resistivity 5.95 μohm cm at 85.2 K.
37	254	L	1932	85.4		22	Similar to above but θ = 90° and electrical resistivity 7.48 μohm cm at 85.4 K.
38	254	L	1932	90.2		23	Similar to above but θ = 0° and electrical resistivity 5.31 μohm cm at 90.3 K.
39	254	L	1932	85.5		24	Similar to above but θ = 8° and electrical resistivity 5.75 μohm cm at 85.5 K.
40	254	L	1932	85.5		26	Similar to above but θ = 28° and electrical resistivity 6.05 μohm cm at 85.6 K.
41	254	L	1932	86.6		27	Similar to above but θ = 46° and electrical resistivity 6.65 μohm cm at 86.6 K.
42	254	L	1932	90.6		28	Similar to above but θ = 46° and electrical resistivity 7.02 μohm cm at 90.5 K.
43	254	L	1932	86.2		30	Similar to above but θ = 0° and electrical resistivity 5.73 μohm cm at 86.2 K.

SPECIFICATION TABLE NO. 31 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
44	598	L	1913	290.5			In liquid state; measurement made on a flowing specimen at a rate of 871 g per 15 min.
45	598	L	1913	288.2			In liquid state; measurement made on a flowing specimen at a rate of 1003 g per 15 min.
46	598	L	1913	289.0			In liquid state; measurement made on a flowing specimen at a rate of 1079 g per 15 min.
47	598	L	1913	290.7			In liquid state; measurement made on a flowing specimen at a rate of 1099 g per 15 min.
48	598	L	1913	288.2			In liquid state; measurement made on a flowing specimen at a rate of 1159 g per 15 min.
49	598	L	1913	288.2			In liquid state; measurement made on a flowing specimen at a rate of 1199 g per 15 min.
50	598	L	1913	287.2			In liquid state; measurement made on a flowing specimen at a rate of 1296 g per 15 min.
51	598	L	1913	288.7			In liquid state; measurement made on a flowing specimen at a rate of 1301 g per 15 min.
52	598	L	1913	288.7			In liquid state; measurement made on a flowing specimen at a rate of 1361 g per 15 min.
53	598	L	1913	288.7			In liquid state; measurement made on a flowing specimen at a rate of 1422 g per 15 min.
54	644	P	1880	278,290			In liquid state; specimen filled in a cylindrical container; thermal conductivity values calculated from measured data of thermal diffusivity, specific heat, and density.
55	638	R	1959	567-717			Chemically pure mercury vapor.
56	639	C	1961	304-343			Triple distilled liquid mercury; contained in a thin-walled reservoir of 3.5 in. deep; electrical resistivity reported as 96.7, 98.6, 101.1, 103.5, 109.1 and 115.0 μohm cm at 30, 50, 75, 100, 150, and 200 C, respectively; first experiment with thermocouples welded on the steel wall of mercury reservoir; stainless steel No. 15 used as comparative material.
57	640	R	1889	476.2			In vapor state; contained in a glass tube of dia 18.2 mm; measured at pressures ranging from 3.0 to 10.3 mm Hg; measured by hot-wire method.
58	641	L	1915	313			In liquid state; contained in a cylindrical vessel of ~4.9 cm dia x 40 cm long.
59	642	L	1887	323			In liquid state; contained in a tube of 13.2 mm dia x 20 cm long.
60	643	P	1864	323.2			In liquid state; thermal conductivity calculated from measured thermal diffusivity.
61	637,592	L	1958	328-700		1	In liquid state.
62	637,592	L	1958	353-556		2	In liquid state.
63	637,592	L	1958	333-560		3	In liquid state.
64	639	C	1961	307-351			Triple distilled liquid mercury; contained in a thin-walled reservoir of 3.5 in. deep; electrical resistivity reported as 96.7, 98.6, 101.1, 103.5, 109.1, and 115.0 μohm cm at 30, 50, 75, 100, 150, and 200 C, respectively; first experiment with thermocouple immersed in the mercury; stainless steel No. 15 used as comparative material.
65	639	C	1961	334.7			Second experiment of the above specimen with thermocouples welded on the steel wall of mercury reservoir, mercury and stainless steel in poor electrical contact.

SPECIFICATION TABLE NO. 31 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
66	639	C	1961	319-383			Second experiment of the above specimen with thermocouples immersed in the mercury.
67	639	C	1961	318-517			Third experiment of the above specimen with a honeycomb of mica inserted to subdivide the mercury column and with thermocouples welded on the steel wall of mercury reservoir.
68	639	C	1961	332-416			Third experiment of the above specimen with thermocouples immersed in the mercury.
69	639	C	1961	307-368			Fourth experiment of the above specimen with the mercury column still further subdivided by the insertion of 36 cellophane drinking straws and with thermocouples welded on the steel wall of mercury reservoir.
70	639	C	1961	326-514			Measurement made on new mercury specimen after having the test apparatus thoroughly cleaned with new thermocouples welded on the steel wall of the mercury reservoir, a honeycomb of mica also being inserted to subdivide mercury column.
71	639	L	1961	304, 333			Similar to the above specimen but measured by guarded hot-plate method.
72	693	L	1963	3.8-4.2			Very pure; crystallized from triple distilled Hg; cylindrical specimen; cast in liquid air; in super conducting state.
73	693	L	1963	3.8-4.2			The above specimen measured in a magnetic field of 600 gauss; in normal state.
74	693	L	1963	3.8-4.2			The above specimen measured in a magnetic field of 800 gauss; in normal state.
75	316	L	1936	373-412	< 3	Amalgam; 1	0.104 Na; liquid specimen contained in a hollow asbestos cylinder; prepared by melting (under paraffin) appropriate amounts of certified pure Hg (from Mallinckrodt Chemical Co.) and Na (from Chemistry Department of Univ. of Kansas) in furnace, the liquid then kept at 150 C for 12 hrs.

234.28	0.329	19.0	0.260	15.0	0.283	16.4	- 37.97

REMARKS

The recommended values are for 99.999+% pure mercury with residual electrical resistivity ρ_0 = 0.000296, 0.000427, and 0.000372 μΩ cm, respectively, for single crystal along directions parallel and perpendicular to trigonal axis and for polycrystalline mercury (characteriztion by ρ_0 becomes important at temperatures below about 40 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature, and 5 to 10% at other temperatures.

---

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated or estimated.

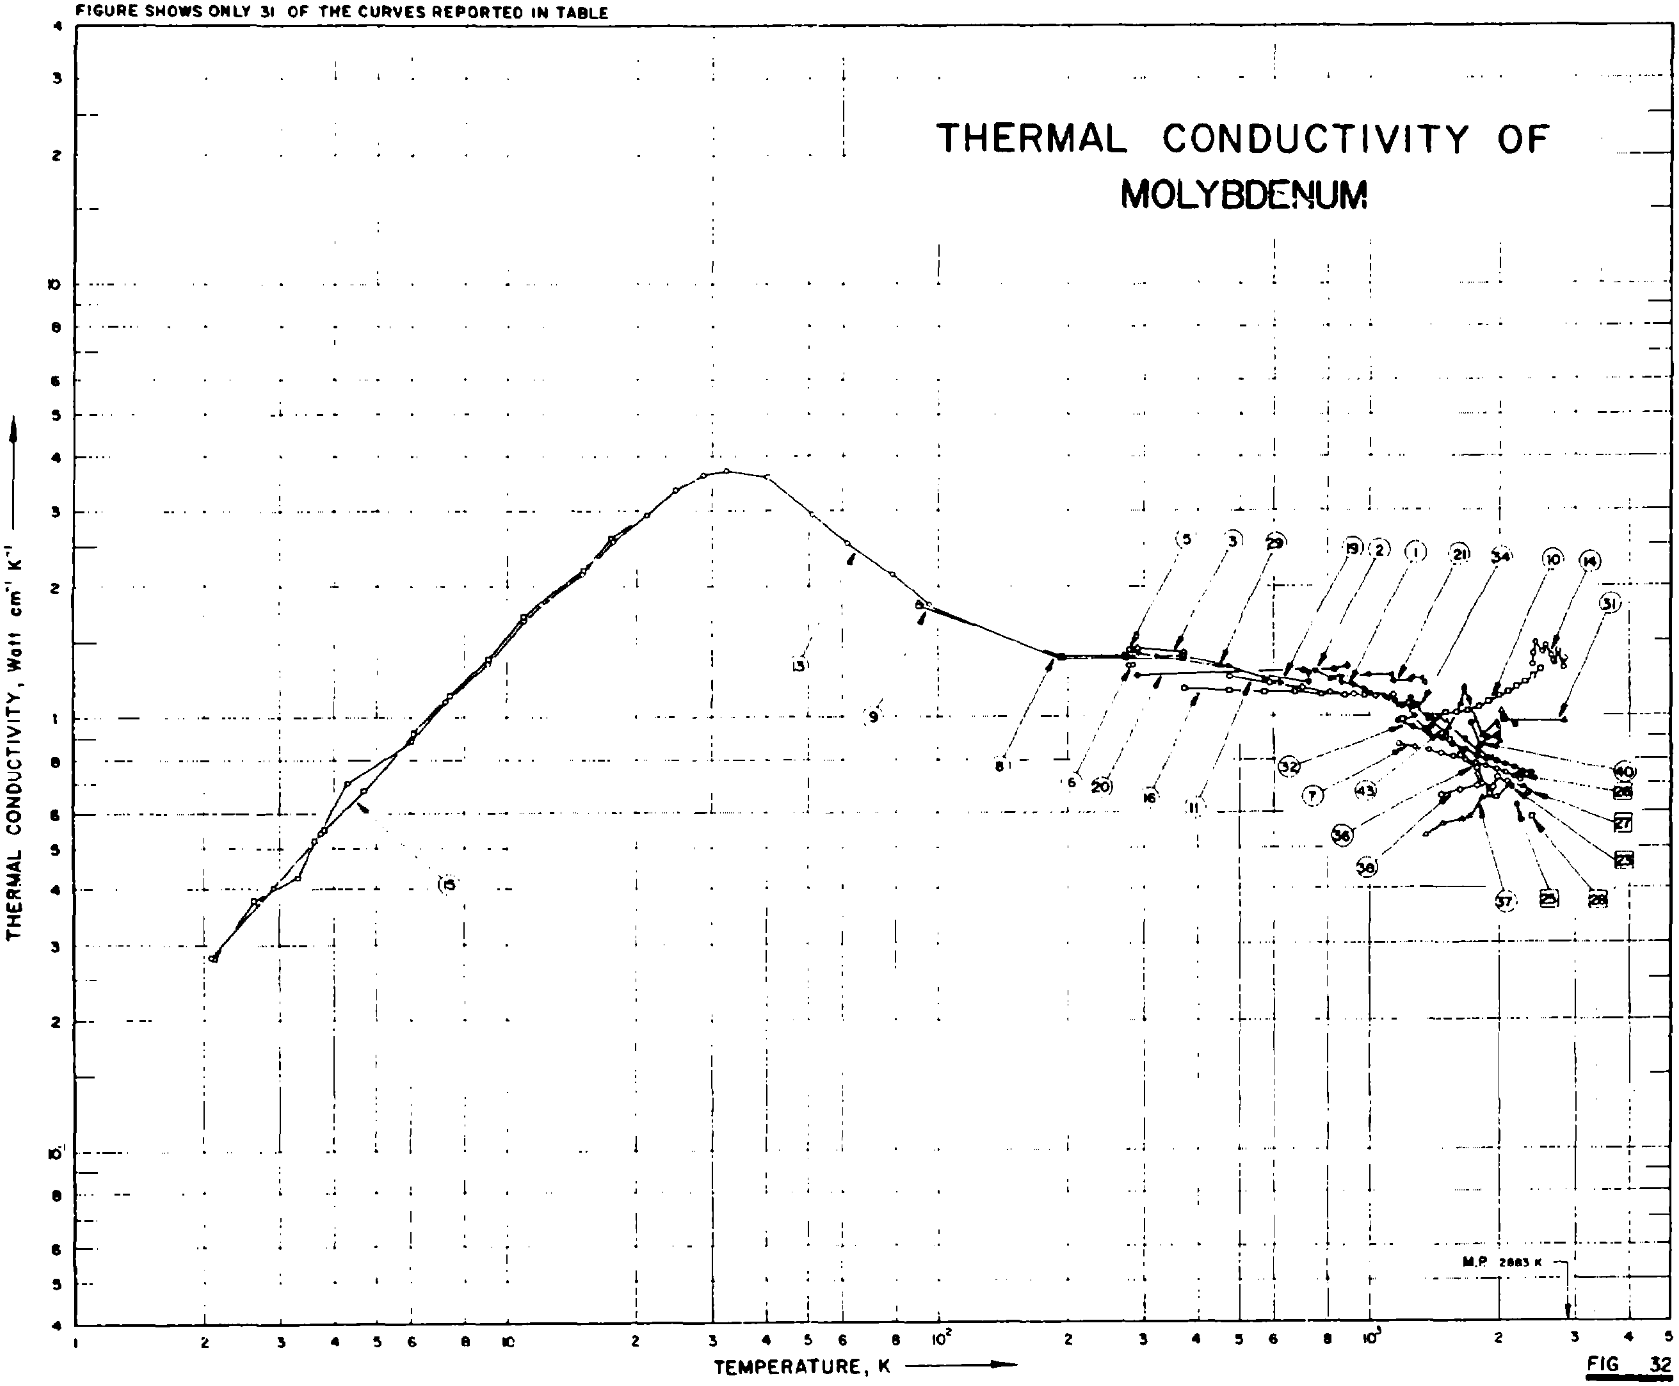

FIG 32

SPECIFICATION TABLE NO. 32 THERMAL CONDUCTIVITY OF MOLYBDENUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 32]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	100	R	1952	811-1422	5		99.9 Mo, < 0.005 Fe, and < 0.003 C; test specimen consisted of 5 stacked disks each of ~5 in. O.D., 0.75 in. I.D., and 0.50 in. thick; obtained from Fansteel Metallurgical Corp.; prepared by powder-metallurgy techniques; pressed, sintered, then rolled to finished size at just below the recrystallization temperature.
2	40	L	1956	749-1915	5		Pure; 7 in. dia x 1.5 in. thick; arc-melted.
3	8	F	1914	290, 373			Pure; 0.0520 cm dia x 45.0 cm long; density 9.933 g cm^{-3}; electrical resistivity reported as 5.806 and 8.516 μohm cm at 0 and 100 C, respectively.
4	78	E	1931	277, 283	2	Mo I	Pure; 0.09983 cm dia x 9.915 cm long; annealed at 220 C; electrical resistivity reported as 5.10 and 5.51 μohm cm at 0 and 18 C, respectively.
5	78	E	1931	278, 283	2	Mo I	The above specimen annealed at 900 C; electrical resistivity 5.07 μohm cm at 0 C.
6	78	E	1931	277, , 282	2	Mo II	Less pure than the above sample; 0.1069 cm dia x 10.14 cm long; annealed at 220 C; electrical resistivity reported as 5.81 and 6.22 μohm cm at 0 and 18 C, respectively.
7	723	R	1965	1173-2248			0.0269 C, < 0.01 Ca, < 0.01 Cu, < 0.01 Fe, < 0.01 Mg, < 0.01 Si, 0.0006 H, 0.0006 O, and 0.00019 N; as received; specimen 1.985 ± 0.015 in. in dia; arc-cast; electrical resistivity reported as 5.6, 17.8, 32.2, 48.0, 63.2, and 73.3 μohm cm at 0, 500, 1000, 1500, 2000, and 2300 C, respectively; density 99% of theoretical value; measurements made on 7 heating and cooling cycles, mean values taken from data of 4th to 7th cycles reported.
8	79	E	1933	90-373		Mo I	99.836+ Mo, 0.05 Bi, 0.05 Cd, 0.01 Al, 0.01 Ge, 0.01 Sn, 0.01 Ti, 0.01 V, 0.01 W, 0.001 Co, 0.001 Cu, 0.001 Pt, 0.001 Rh, and trace of C; 0.09979 cm dia x 12.627 cm long; electrical resistivity reported as 0.952, 3.39, 5.25, and 7.67 μohm cm at -183.00, -78.50, 0, and 100 C, respectively.
9	79	E	1933	90-373		Mo 2	Cut from the same wire as the above specimen; 0.09980 cm dia x 9.859 cm long; electrical resistivity reported as 0.882, 3.33, 5.17, 7.56, and 10.05 μohm cm at -183.00, -78.50, 0, 100, and 217.96 C, respectively.
10	156	E	1927	1200-2500			Pure; electrical resistivity reported as 29.2, 32.2, 35.2, 38.2, 41.2, 44.3, 47.3, 50.4, 53.5, 56.6, 59.7, 62.8, 66.0, and 69.2 μohm cm at 1200, 1300, 1400, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, and 2500 K, respectively.
11	89	C	1956	478-1144			Pure; supplied by Climax Molybdenum Co.; 2 cm dia x 15 cm long; arc melted; density 10.24 g cm^{-3}; Armco iron used as comparative material.
12	996	L	1967	86-377			Spectroscopically standardized molybdenum; 5 mm dia x 10 cm long; supplied by Johnson, Matthey & Co.; electrical resistivity reported as 0.18, 0.57, 0.80, 3.20, 5.55, and 7.31 μohm cm at 4, 76, 91, 194, 297, and 374 K, respectively.

SPECIFICATION TABLE NO. 32 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
13	122	L	1955	2.1-95	± 3	JM 2331; Mo 1	99.95 pure; polycrystalline; 0.52 cm dia x 2.85 cm long; obtained from Johnson, Matthey; electrical resistivity reported as 1.44, 1.44, 1.45, 1.49, 1.51, 1.80, 2.26, and 2.84 μ ohm cm at 20.4, 25.2, 29.3, 37.2, 48.6, 58.8, 75.3, and 90.1 K, respectively.
14	255	E	1960	2384-2849			0.18 Fe, 0.073 Si, 0.04 C, 0.036 Mn, 0.005 O, and 0.01 others; arc-melted and cast under inert gas, hot-worked, and hot-rolled, polished; 0.125 in. dia x 10 in. long; obtained from Fansteel Corp.
15	97	L	1952	2.1-21	2-3	JM 2331; Mo I	99.95 pure; 1-2 mm dia x 5 cm long; supplied by Johnson-Matthey.
16	414	L	1954	373-973	± 2		Coarse grain structure on the outside and fine grain structure in the interior; with a large number of inclusions; 1 in. bar, forged and machined.
17	503	E	1961	1068-1183			99.98 pure; 1 mm wire; obtained from Radium-Elektrizitatsqesellsch, Wipperfurth; polished; annealed in vacuo for 12 hrs at about 1000 C; electrical resistivity reported as 24.4, 25.5, 26.9, 28.3, and 29.7 μ ohm cm at 761, 800, 850, 900, and 950 C, respectively.
18	543	C	1955	473-1173	≤ 5	Heat No. 990	Recrystallized at 1505 C; measured in a vacuum of 2 x 10^{-5} mm Hg; Armco iron used as comparative material; data taken from smoothed curve.
19	599	E	1961	290-871			99.9 pure; received from Fansteel Metallurgical Corp; electrical resistivity 5.98 μ ohm cm at 23 C.
20	599	E	1961	290-890			2nd run of the above specimen.
21	599	E	1961	290-1325			3rd run of the above specimen.
22	1011	E	1961	1122.1727			Tubular specimen 8 mm O.D., 5 mm I.D., and 100 mm long.
23	601		1962	2129			Heated in high vacuum (10^{-5} mm Hg) by high frequency induction to 1000 to 3000 C; localized heating within 0.003 in. of the surface at current frequencies of 500000 cps; specimen 0.4923 in. in dia and 0.863 in. in length; measured with the cylindrical axis parallel to the magnetic field; run G-2.
24	601		1962	2161			The above specimen; run G-3.
25	601		1962	2200			The above specimen; run G-5.
26	601		1962	2216.5			The above specimen; run G-4.
27	601		1962	2351.5			The above specimen; run M-1.
28	601		1962	2382			The above specimen; run M-3.
29	652	L, C	1961	323-623		JM 720	Spectrographically standardized molybdenum; obtained from Johnson, Matthey and Co.; rod of about 5 mm in dia and 15 cm in length; electrical resistivity reported as 5.65, 6.25, 7.45, 9.9, 12.45, 13.75, 15.1, 17.85, 20.6, 23.3, 26, 28.7, 31.5, 34.4, 37.2, 40.1, 43, and 44.7 μ ohm cm at 20, 50, 100, 200, 300, 350, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, and 1450 C, respectively; Armco iron used as comparative material.

SPECIFICATION TABLE NO. 42 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
30	653	E	1963	1075-1640			Single crystal; ~~Lorentz~~ Lorenz function reported as 2.87, 2.76, 2.72, 2.71, 2.66, 2.57, and 2.33 x $10^{-8} V^2 K^{-2}$ at 1080, 1200, 1310, 1320, 1420, 1540, and 1650 K, respectively.
31	667	E	1962	1520-2085	± 10		Spectrographically pure; wire specimen 0.010 in. in dia; electrical resistivity reported as 41.3, 50.6, 58.1, and 59.1 μ ohm cm at 1550, 1830, 2040, and 2110 K, respectively; measured in a vacuum of < 10^{-5} mm Hg.
32	600, 709	E	1960	1173-2473			Wire; 1 mm in dia, 30 mm long; electrical resistivity reported as 27.8, 35.6, 45.2, 56.4, and 74.8 μohm cm at 1173, 1473, 1773, 2073, and 2473 K, respectively; data taken from smoothed curve.
33	654	P	1965	1340-2510	± 5		99.99 Mo (by difference), < 0.01 Fe, and traces of other elements; 0.04 in. thick sheet; obtained from Murex Co.; sintered and hot rolled; average grain size (after test) 110 μ; density 10.3 g cm^{-3}; thermal conductivity values calculated from measured thermal diffusivity data using the specific heat data compiled by Kubaschewski, O., and Evans, L. Ll. (Metallurgical Thermochemistry, Pergamon, London, 1956).
34	710	E	1938	1207-1400			Very pure; 20-mil wire; polished; aged at about 2200 K for 15 min; electrical resistivity reported as 26.4, 32.3, 37.8, 42.8, and 47.4 μohm cm at 1110, 1325, 1515, 1685, and 1840 K, respectively.
35	710	E	1938	1315-1647			Same as the above specimen.
36	710	E	1938	1545-1905			Same as the above specimen.
37	711	R	1965	1362-2282	6	Sample 1	99.98+ Mo, 0.005 Fe, 0.004 Si, 0.003 Ni, 0.0023 O, 0.0021 C, 0.001 V, < 0.0005 N, and 0.00023 H; specimen 2.118 cm in dia and 0.225 cm thick; prepared by powder metallurgy techniques; polished with No. 4/0 emery paper; average grain dia 34 μ; density 9.104 g cm^{-3}; experiment performed in high vacuum (10^{-5} mm Hg); specimen heated by high frequency induction current; specimen axis parallel to the axis of magnetic field; data calculated from total emittance measurements using specific heat data from an empirical formula whose agreement with those of Kirilin, V.A. et al was within 2%; run No. 1.
38	711	R	1965	1476-2100	6	Sample 1	99.964+ Mo, 0.028 C, 0.0021 O, 0.002 Si, 0.001 Cu, 0.001 Fe, 0.001 V, < 0.0005 N, and 0.00015 H; specimen 1.905 cm in dia, 0.206 cm thick; prepared by arc-melting technique; average grain dia 706 μ; density 10.119 g cm^{-3}; same measuring conditions and method as above; run No. 1.
39	711	R	1965	1687-2272	6	Sample 2	The above specimen; run No. 2.
40	711	R	1965	1740-2194	6	Sample 3	99.948+ Mo, 0.011 C, < 0.01 Fe, < 0.01 Si, < 0.01 Ti, < 0.01 Zr, 0.003 O, 0.0006 N, and 0.0002 H; specimen 1.910 cm in dia, 0.195 cm thick; prepared by arc-melting and heated to 2500 K for very long times in hydrogen such that it underwent grain growth; average grain dia 4850 μ; density 10.163 g cm^{-3}; same measuring condition and method as above; run No. 1.
41	711	R	1965	1592-1974	6	Sample 3	The above specimen; run No. 2.

REMARKS

The recommended values are for well-annealed 99.95⁺% pure molybdenum with residual electrical resistivity $\rho_0 = 0.167\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 250 K). The values below 1.5 T_m are calculated to fit the experimental data by using $n = 2.60$, $\alpha' = 7.76 \times 10^{-6}$, and $\beta = 6.85$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature, and 4 to 10% at other temperatures.

* T_1 in K, k_1 in Watt $cm^{-1}\ K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1}\ ft^{-1}\ F^{-1}$.

‡ Values in parentheses are extrapolated.

[For Data Reported in Figure and Table No. 35]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	114	L	1950	32-300	1.2-2.0	"L" Nickel	Commercially pure; 0.5 in. dia x 20 in. long; supplied by International Nickel Co.
2	124	P	1930	327-1016			Pure nickel, electrolyzed from Mond anodes; wire, about 0.2 cm in dia; vacuum melted under a pressure of 0.3 mm Hg using an Arsen furnace and an alundum crucible; chill cast, forged, and cold drawn to the above dimensions, annealed twice at about 750 C for several hrs; electrical conductivity reported as 9.60, 5.95, 4.10, 3.03, 2.74, 2.47, and 2.32 x 10^4 ohm^{-1} cm^{-1} at 54, 179, 285, 407, 530, 676, and 743 C, respectively; density 8.74 g cm^{-3}; thermal conductivity values calculated from measured data of thermal diffusivity, specific heat, and density.
3	129	C	1933	330-775	5	N_1	99.94 Ni, 0.03 Fe, 0.016 Co, 0.006 Cu, 0.006 Si, 0.005 C, and 0.004 S; specimen 2 cm in dia and 15 cm long; melted in Arsen furnace and furnace cooled; lead used as comparative material, reference value taken from International Critical Tables ~~(Vol. II, p. 210)~~ (Vol. V, p. 221).
4	101	L	1955	363-780	3		99.65 pure (by difference), 0.094 Si, 0.082 Cu, 0.056 Fe, 0.027 C, 0.025 Co, 0.008 S, and 0.007 Al; specimen 7.938 in. long and 0.787 in. in dia; prepared in a zircon crucible from high purity electrolytic nickel shot, hot rolled at 1000 C to a bar 1 in. square, machined and ground to size; annealed for 45 min at 1000 C in hydrogen atmosphere.
5	83	L	1956	2.0-136		JM 4497	99.99 Ni, traces of Al, Ca, Cu, Si, Ag, and very faint traces of Li, Mg, and Na; material obtained from Johnson Matthey Co.; specimen 2 mm in dia; annealed for 4 hrs in vacuo at 750 C; electrical resistivity 7.22 μohm cm at 293 K; residual electrical resistivity 0.0347 μohm cm.
6	122	L	1955	2.0-44	3	JM 4884; Ni 1	99.997 pure; polycrystalline; specimen 2.92 cm long, 0.305 cm in dia; obtained from Johnson Matthey Co. (JM 4884); annealed at 1150 C for several hrs in vacuo; electrical resistivity ratio $\rho(293K)/\rho(20K)$ = 80.9.
7	186	P	1928	305.2		R-12	Wire about 35 cm long, 0.32 cm in dia; electrical conductivity 9.66 x 10^4 ohm^{-1} cm^{-1} at approx 32 C; thermal conductivity value calculated from measured data of thermal diffusivity and specific heat.
8	238	E	1927	303.2			0.10 Fe, 0.037 C, 0.019 S, 0.013 Cu, 0.006 Si, traces of Al, Co, Mn, and P; specimen 20 cm long, 5 mm in dia; obtained from Mond and Co.; cast and machined, annealed for 40 min at 800 C; electrical resistivity 8.58 μohm cm at 30 C.
9	499	P	1937	298.2	0.06		99.98 pure; annealed in hydrogen at 870 C; density 8.79 g cm^{-3}; electrical resistivity 7.21 μohm cm at 22 C; thermal conductivity value calculated from measured data of thermal diffusivity, specific heat, and density.
10	230	L	1925	329.2		Electrolytic nickel	99.75-99.85 pure; supplied by International Nickel Co. of America; electrical conductivity 8.24 x 10^4 ohm^{-1} cm^{-1}.
11	496	C	1940	80, 273	< 1		Specimen 60 mm long, 4 mm in dia; copper used as comparative material.
12	500	C	1954	333-763		Nivac	Extremely pure; specimen 1 in. cube; supplied by the Vacuum Metal Corp; vacuum cast.
13	500	C	1954	333-753			Similar to the above specimen but with cylindrical pores of 0.346 cm in dia; porosity 9.8%.

SPECIFICATION TABLE NO. 35 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
14	500	C	1954	343-1073			Similar to the above specimen but porosity 19.5%.
15	503	E	1961	1093-1263		Nickel O	99.95 pure; wire 1 mm in dia; vacuum melted and cast; polished; annealed for 12 hrs at ~1000 C.
16	504	P	1961	295.2	± 5		1.26 cm dia x 0.100 cm thick; thermal conductivity value calculated from measured data of thermal diffusivity and specific heat, and density value taken from Smithsonian Physical Tables (9th ed., 1954).
17	618	C	1960	305-323	± 3		Specimen 20 mm in dia and 18 mm long; steel used as comparative material.
18	618	C	1960	303-317	± 3		The above specimen using pure Ni as comparative material.
19	618	C	1960	302-320	± 3		The above specimen using yellow brass as a comparative material.
20	618	C	1960	305-321	± 3		The above specimen using Al as comparative material.
21	594	R	1961	778-1462		"L" nickel	Specimen consisted of 5 vertically stacked hollow cylinders, each 2.625 in. O.D. and 1 in. high, and having a 0.25 in. bore concentric with the axis.
22	40	L	1956	778-1615	5	"A" nickel	Disk, 7 in. in dia and 1.5 in. thick; density 8.844 g cm^{-3}.
23	276	C	1953	343.2	3	"A" nickel	Cylinder 1.75 in. long and 0.22 in. in dia; density 8.8 g cm^{-3}; Armco iron used as comparative material.
24	675	L, C	1965	323-1123		Electrolytic nickel; Sample 1	< 0.03 Fe, < 0.01 each of Al, Cr, Co, Cu, Mg, Mn, Mo, Si, Sn, Ti, Zn, and Zr, < 0.005 Pb, and < 0.002 B; supplied by The Castner Kellner Alkali Co.; tube of 1.272 cm I.D., 1.908 cm O.D., and 20 cm long, density 8.61 g cm^{-3}; electrical resistivity reported as 7.1, 8.3, 13.0, 19.4, 28.0, 32.8, 36.1, 39.3, 42.4, and 45.2 μohm cm at 293, 323, 423, 523, 623, 723, 823, 923, 1023, and 1123 K, respectively; Armco iron used as comparative material; data taken from smoothed curve.
25	675	L, C	1965	323-823		Electrolytic nickel; Sample 2	Very high purity; supplied by the National Engineering Lab.; tube with 0.634 cm I.D., 2.801 cm O.D., and 19 cm long; density 8.90 g cm^{-3}; electrical resistivity reported as 10.6, 18.5, 20.7, and 33.2 μohm cm at 100, 260, 290, and 500 C, respectively; Armco iron used as comparative material; data taken from smoothed curve.
26	675	L, C	1965	323-823		Electrolytic nickel; Sample 3	99.5 + 0.1 Ni, 0.1-0.2 Co, 0.1-0.2 Si, 0.04 Fe, 0.03 Mg, and 0.01 Cr; supplied by the Atomic Energy Research Establishment in the form of 3 tubes of 1.589 cm O.D., 1.538 cm I.D. and about 43 cm long, 32 strips each 0.95 cm wide and 14 cm long were cut from the tubes and pressed together to form a compact specimen; density 8.9 g cm^{-3}; electrical resistivity reported as 8.3, 9.6, 14.3, 20.6, 29.7, 34.1, and 37.3 μohm cm at 293, 324, 423, 523, 623, 723, and 823 K, respectively; Armco iron used as comparative material; data taken from smoothed curve.
27	675	L, C	1965	323-623		Electrolytic nickel; Sample 4	Commercial nickel; rod 2.54 cm in dia, about 20 cm long; supplied by the Explosives Research and Development Establishment; electrical resistivity reported as 10.1, 11.3, 16.3, 22.8, and 31.5 μohm cm at 293, 323, 423, 523, and 623 K, respectively; Armco iron used as comparative material; data taken from smoothed curve.

SPECIFICATION TABLE NO. 35 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
28	675	L, C	1965	323-1323		Electrolytic nickel; Sample 5	High spectrographic purity; very small impurities of Al, Ca, Cu, Li, Si, Ag, Mg, and Na; supplied by Johnson Matthey Co. (Laboratory No. 4457); rod 0.5 cm in dia and 15 cm long; density 8.91 g cm^{-3}; electrical resistivity reported as 7.1, 8.3, 13.1, 19.4, 28.3, 33.2, 36.4, 39.2, 42.1, 44.7, 47.5, and 49.8 μohm cm at 293, 323, 423, 523, 623, 723, 823, 923, 1023, 1123, 1223, and 1323 K, respectively; Armco iron used as comparative material; data taken from smoothed curve.
29	716	L	1962	4.2, 81		Ni 5011 (I)	Specimen 0.15 cm in dia turned from a cylindrical sample 5.2 cm long; supplied by Johnson Matthey Co.; annealed for 4 hrs at 1273 K in vacuum of 10^{-6} mm Hg, then furnace cooled at a rate of 150 K per hr; electrical resistivity reported as 0.11, 0.676, and 7.16 μohm cm at 4.18, 80.5, and 292 K, respectively; electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 60$.
30	716	L	1962	4.18	14	Ni 5011 (II)	Specimen 0.19 cm in dia drawn from a cylindrical sample 5.0 cm long; supplied by Johnson Matthey Co.; annealed for 10 hrs at 1573 K in hydrogen and left at 1573 K in a vacuum of 10^{-2} mm Hg for 2 hrs; electrical resistivity reported as 0.0213, 0.60, and 6.35 μohm cm at 4.18, 80.5, and 273.15 K, respectively; $\rho(273K)/\rho(4.2K) = 298$.
31	39	L	1927	80, 273		Electrolytic nickel	Electrical conductivity reported as 90.2 and 13.05 x 10^4 ohm^{-1} cm^{-1} at 80 and 273 K, respectively.
32	736	L	1965	0.42-0.95	1		Pure.
33	737, 877	E	1965	373-773	± 2	No. 1	99.87 Ni + Co; tube 8.51 mm O.D. and 8.025 mm I.D.; electrical resistivity reported as 7.90, 9.30, 11.50, 17.24, 24.70, 31.84, and 35.36 μohm cm at 20, 50, 100, 200, 300, 400, and 500 C, respectively.
34	737	E	1965	373-748	± 2	No. 2	Tube 12.96 mm O.D. and 11.025 mm I.D.; electrical resistivity reported as 11.60, 17.29, 24.74, 32.01, and 33.98 μohm cm at 100, 200, 300, 400, and 475 C, respectively.
35	743	E	1964	340-920			99.999 pure; specimen 30 cm long and 0.3 cm in dia, annealed in vacuum for 48 hrs at 1173 K; electrical resistivity reported as 8.0, 11.5, 17.0, 24.5, 29.0, 35.0, 38.5, 42.0, 44.0, and 46.0 μohm cm at 40, 105, 210, 305, 375, 485, 590, 720, 780, and 900 C, respectively.
36	846	E	1967	1201-1393			99.95 pure; 14 cm x 1 cm x 0.05cm; obtained from Johnson, Matthey and Co., London; data obtained without heating the ends of the specimen.
37	846	E	1967	1202-1386			99.95 pure; 14 cm x 1 cm x 0.05 cm; obtained from Johnson, Matthey and Co., London; measuring technique improved by heating the ends of the specimen.
38	843	P	1966	298.2			Spherical granular specimen supplied by Linde Co. contained in a 0.75 in. dia x 2 in. long cylindrical cell; mesh size -230 +325; thermal conductivity measured by the transient line source method; measured in Freon-12 under a pressure of ~100 psig.
39	843	P	1966	298.2			Similar to above; measured in argon under a pressure of ~100 psig.

SPECIFICATION TABLE NO. 35 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
40	843	P	1966	298.2			Similar to above; measured in nitrogen under a pressure of ~100 psig.
41	843	P	1966	298.2			Similar to above; measured in methane under a pressure of ~100 psig.
42	843	P	1966	298.2			Similar to above; measured in helium under a pressure of ~100 psig.
43	843	P	1966	298.2			Similar to above; measured in hydrogen under a pressure of ~100 psig.
44	917	E	1965	2.0-90	0.5-5	A	0.0016 impurities (mostly Fe and Si); polycrystalline; 2 mm in dia; obtained from Johnson Matthey and Co.; annealed for 12 hrs at 850 C; electrical resistivity reported as 0.0005998, 0.001197, 0.003741, 0.005248, 0.009616, 0.01675, 0.04624, and 0.0719 μohm cm at 5.5, 8.1, 13.4, 16.1, 20.1, 24.7, 34.4, and 40.0 K, respectively.
45	917	E	1965	5.7-114	0.5-5	B	0.13 Cu; specimen 4 mm in dia; supplied by Johnson Matthey and Co.; chill cast from J.M. 890 Ni and J.M. 30 Cu; annealed for 12 hrs at 850 C.
46	186	P	1928	305.2		A nickel	0.25 cm dia x 35 cm long; density 8.90 g cm^{-3}; thermal conductivity value calculated from measured data of thermal diffusivity, specific heat, and density.

REMARKS

The recommended values are for well-annealed 99.99$^+$% pure nickel with residual electrical resistivity ρ_0 = 0.0384 μΩ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, α' = 9.57 x 10^{-5}, and β = 1.57. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature, and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated.

THERMAL CONDUCTIVITY OF NIOBIUM

FIGURE SHOWS ONLY 49 OF THE CURVES REPORTED IN TABLE

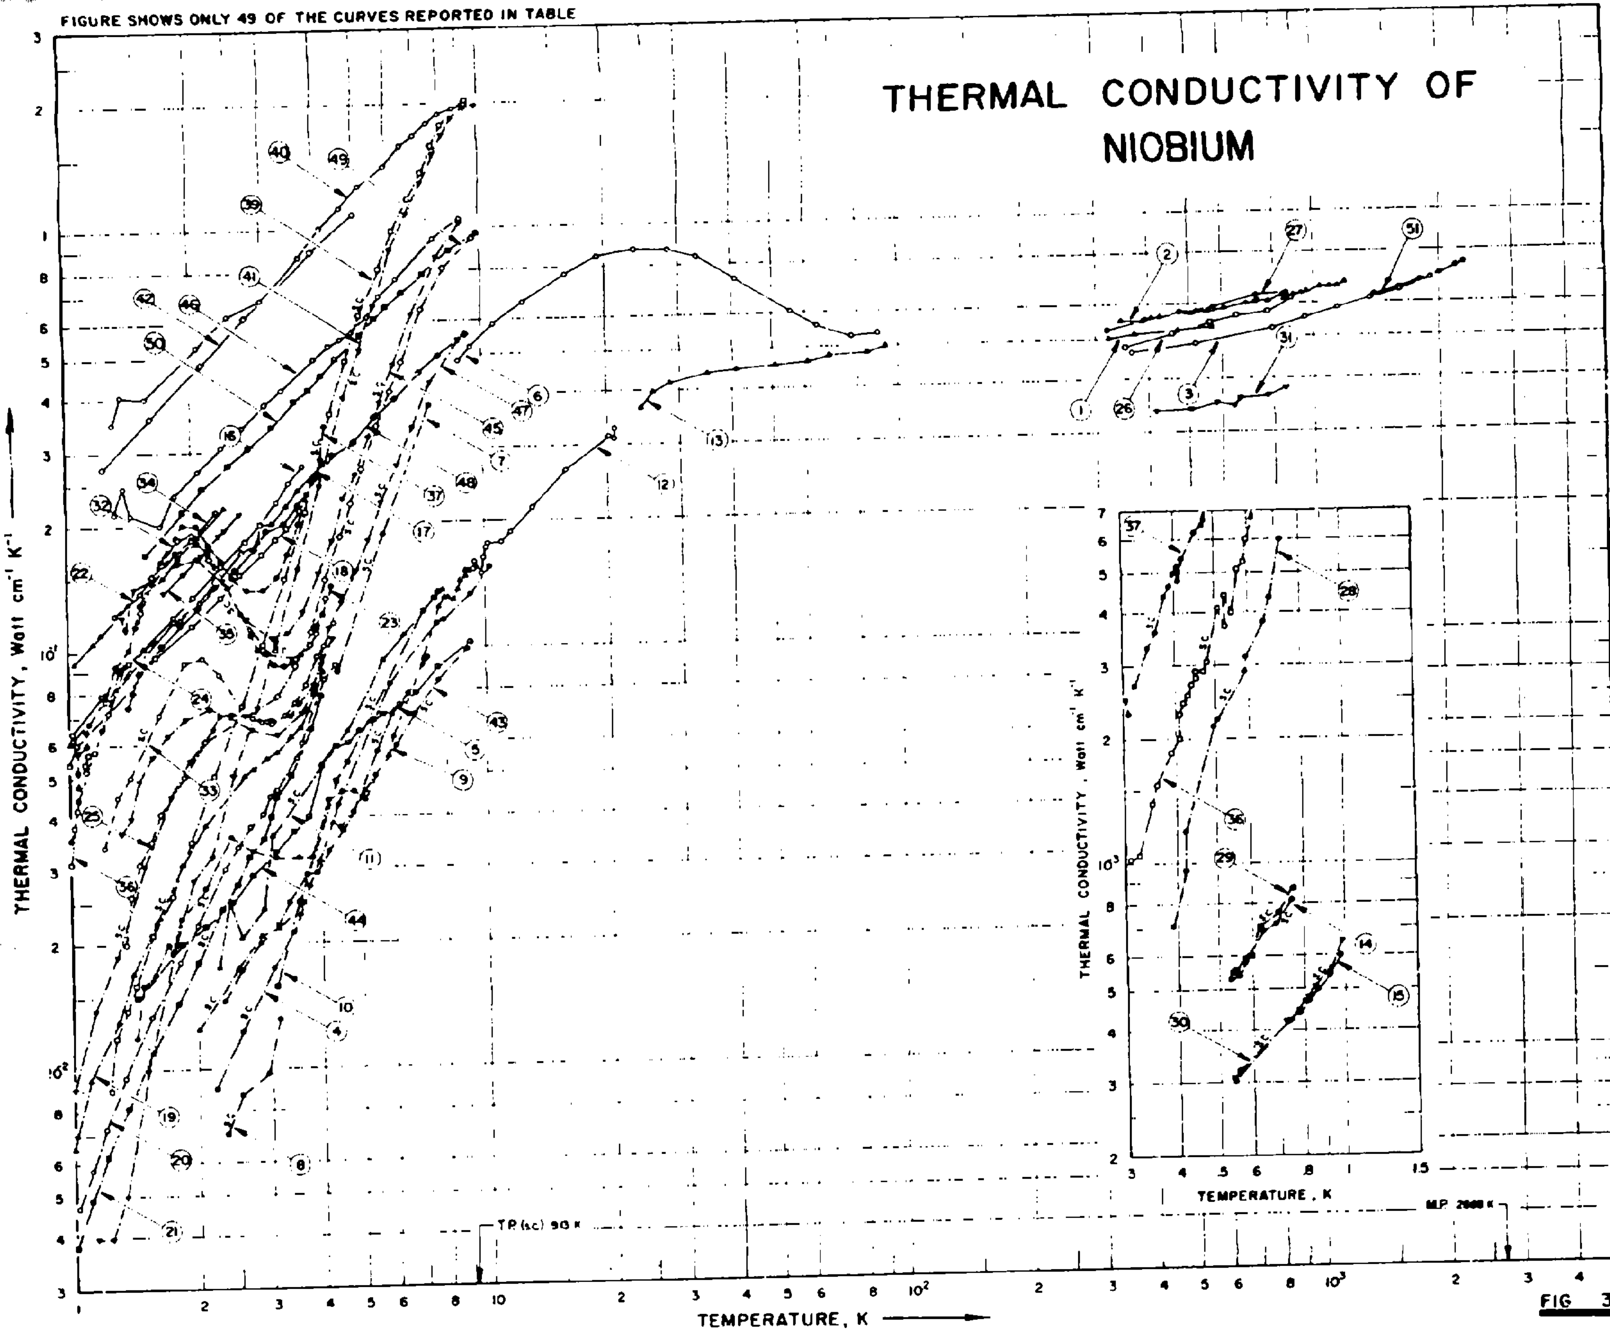

FIG 36

SPECIFICATION TABLE NO. 36 THERMAL CONDUCTIVITY OF NIOBIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 36]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	652	C	1961	323-573			< 0.1 Ta, 0.015 Ti, < 0.01 C, < 0.01 Fe, < 0.01 N, < 0.01 O, and < 0.01 Si; ~6 mm dia x 10 cm long; manufactured by Murex Ltd; sintered above 2000 C and cold swaged; electrical resistivity reported as 15.0, 16.5, 18.7, 23.2, and 27.7 μohm cm at 293, 323, 373, 473, and 573 K, respectively; Armco iron used as comparative material.
2	728	P	1965	345-1195			99.95 Nb, 0.011 O, 0.005 C, 0.0027 N, and 0.0006 H; specimen 0.25 in. in dia and 2 in. long; obtained from Kawecki Chemical Co.; refined by electron beam melting, annealed and machined to size; density 8.61 g cm^{-3}; electrical resistivity reported as 15.2, 28.2, 39.1, and 49.3 μohm cm at 300, 600, 900, and 1200 K, respectively; thermal conductivity values calculated from measured data of thermal diffusivity and specific heat data taken from Jaeger, F.M. and Veenstra, W.A. (Rec. Trav. Chim., 53, 677, 1934).
3	39	R	1958	365-1911			High purity; specimen consisted three stacked disks each of 0.625 in. I.D., 3.0 in. O.D., and 1 in. thick.
4	96	L	1950	2.2-10	2.0-5.0		High purity; in normal state; measured in a magnetic field.
5	96	L	1950	2.3-7.3	2.0-5.0		High purity; in superconducting state.
6	151	L	1957	8.9-90		Nb 5	99.9 pure; wire drawn from a rod of ductile niobium 1.59 mm dia obtained from Fansteel Metallurgical Corp; ideal electrical resistivity reported as 0.038, 0.084, 0.25, 0.53, 0.97, 2.35, 3.90, 7.0, 9.8, 12.3, 13.5, and 14.5 μohm cm at 15, 20, 30, 40, 50, 75, 100, 150, 200, 250, 273, and 295 K, respectively; residual electrical resistivity ~~[illegible]~~ 0.476 μohm cm; transition temp 9.25 K; in normal state.
7	151	L	1957	4.4-7.5		Nb 5	The above specimen measured in superconducting state.
8	97	L	1952	2.3-3.1	2.0-3.0	JM 4526; Nb 1	99.99 pure; polycrystalline; magnetic field "frozen in"; in superconducting state; measured after removing the applied magnetic field.
9	97	L	1952	2.0-9.2	2.0-3.0	Nb 1	The above specimen in superconducting state; measured before applying any magnetic field.
10	97	L	1952	3.1-7.8	2.0-3.0	Nb 1	The above specimen measured in a field of 2300 gauss; assumed in superconducting state below 6 K and in normal state above 6 K.
11	97	L	1952	2.3-7.9	2.0-3.0	Nb 1	The above specimen measured in a field of 3300 gauss; assumed in superconducting state below 5 K and in normal state above 5 K.
12	97	L	1952	9.5-21	2.0-3.0	Nb 1	The above specimen in normal state.
13	122	L	1955	24-94	3.0	JM 4526; Nb 1	99.99 pure; polycrystalline; 0.470 cm dia x 3.03 cm long; electrical resistivity reported as 0.145, 0.149, 0.153, 0.166, 0.183, 0.220, 0.276, 0.319, 0.416, and 0.462 μohm cm at 20.6, 23.4, 26.2, 31.7, 38.9, 47.7, 59.2, 67.1, 82.9, and 90.0 K, respectively.
14	400	L	1953	0.54-0.75		Nb 1	99.99 pure; polycrystalline; magnetic field "frozen in"; in superconducting state; measured after removing the applied magnetic field.

SPECIFICATION TABLE NO. 36 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
15	400	L	1953	0.55-0.97		Nb 1	99.99 pure; polycrystalline; in superconducting state; measured before applying the magnetic field.
16	389	L	1958	1.0-3.7			Rod specimen; in normal state.
17	389	L	1958	1.0-4.2			The above specimen bent to 5-13.4% strained; in normal state.
18	389	L	1958	1.0-3.7			The above specimen bent to 19.5% strained; in normal state.
19	389, 676	L	1958	0.97-4.2			Single crystal; rod specimen; zone refined; not intentionally annealed; bent to 5.1% strained; in superconducting state.
20	389, 676	L	1958	1.0-4.4			The above specimen bent to 13.4% strained; in superconducting state.
21	389, 676	L	1958	0.87-4.1			The above specimen bent to 19.5% strained; in superconducting state.
22	389, 501	L	1958	[illegible]0-2.4		Nb II	0.0063 Cu and 0.0003 Mg; single crystal; specimen made by floating zone melting of polycrystalline rod; in normal state (data reported in Ref. 389 are 10 times higher than those reported in Ref. 501 and the latter are used).
23	389, 501	L	1958	1.0-4.3		Nb II	The above specimen in superconducting state (data reported in Ref. 389 are 10 times higher than those reported in Ref. 501 and the latter are used).
24	389, 501	L	[illegible]58	1.0-3.0		Nb I	Similar to the above specimen; not intentionally annealed; in normal state (data reported in Ref. 389 are 10 times higher than those reported in Ref. 501 and the latter are used).
25	389, 501, 676	L	1958	1.0-4.3		Nb I	The above specimen in superconducting state (data reported in Ref. 389 are 10 times higher than those reported in Ref. 501 and the latter are used).
26	413, 138	L	1955	353-888			99.95 Nb and · 0.05 O; rectangular specimen; density 8.38 g cm^{-3}; electrical resistivity reported as 16.41, 20.85, 25.22, 29.74, 34.19, 38.63, 43.07, and 45.30 μohm cm at 0, 100, 200, 300, 400, 500, 600, and 650 C, respectively.
27	413, 138	L	1955	323-856			99.95 Nb and · 0.05 O; cylindrical specimen; density 8.65 g cm^{-3}; electrical resistivity reported as 15.22, 19.18, 23.13, 27.09, 31.04, 35.00, and 38.96 μohm cm at 0, 100, 200, 300, 400, 500, and 600 C, respectively.
28	412	L	1955	0.39-0.72		JM 4526	99.99 pure; polycrystalline; measured with magnetic shielding; in superconducting state.
29	412	L	1955	0.54-0.76			The above specimen measured without magnetic shielding; in superconducting state.
30	412	L	1955	0.54-0.99			Same as above, 2nd run.
31	606	L	1954	417-853			Density 7.73 g cm^{-3}; electrical resistivity reported as 31.25, 35.78, 40.30, 44.83, 49.35, 53.88, and 58.40 μohm cm at 0, 100, 200, 300, 400, 500, and 600 C, respectively.

SPECIFICATION TABLE NO. 36 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
32	677	L	1960	1.1-4.2			Single crystal; 4 mm in dia and 50 mm long; prepared by the "floating zone" technique in an electron bombardment furnace; in superconducting state.
33	677	L	1960	1.2-4.4			The above specimen irradiated by a dose of 10^{18} fast neutrons cm^{-2} at 30 ±5 C, then allowed a few weeks for radioactivity to decay; in superconducting state.
34	677	L	1960	1.3-2.3			The above specimen before irradiation; in normal state; measured in a magnetic field.
35	677	L	1960	1.7-2.6			The above irradiated specimen (curve 33) in normal state; measured in a magnetic field.
35	705	L	1962	0.26-1.2	5	Nb II	0.0003 Cu and 0.0003 Mg; single crystal; dia 4.0 mm; ratio of length to cross sectional area 25.7 cm^{-1}, obtained by the floating zone melting of polycrystalline rod of niobium in vacuum; electrical resistivity ratio $\rho(298K)/\rho_0$ = 60.5; in superconducting state.
37	705	L	1962	0.25-4.2	5	Nb III	Dia 2.2 mm, ratio of length to cross sectional area 89.6 cm^{-1}; electrical resistivity ratio $\rho(298K)/\rho_0$ = 120.0; in superconducting state.
38	724	L, C	1957	373, 473		Sample B	0.1 Ta; electrical resistivity reported as 16.2, 19.5, and 23.5 μohm cm at 20, 100, and 200 C, respectively; Armco iron used as comparative material.
39	847	L	1966	1.2-9.4	10	Nb I	0.03 Al, 0.03 Fe, 0.02 Si, 0.01 C, < 0.01 Cl, < 0.01 Cr, < 0.01 Pb, and < 0.01 Mn; single crystal; 2.34 mm in dia and 20 mm long; supplied by Johnson Matthey and Co.; obtained by fusion in a floating zone by electronic bombardment; residual electrical resistivity 0.09 μohm cm; transition temp 9.5 K; in superconducting state.
40	847	L	1966	1.3-9.4	10	Nb I	The above specimen in normal state.
41	847	L	1966	1.1-9.9	10	Nb I	The above specimen irradiated by 5.6 x 10^{17} fast neutrons cm^{-2}; residual electrical resistivity 0.11 μohm cm; in superconducting state.
42	847	L	1966	1.2-5.0	10	Nb I	The above specimen in normal state.
43	847	L	1966	1.4-9.0	10	Nb I	The above specimen annealed at 1870 C in a vacuum of 5 x 10^{-6} torr for 63 hrs; residual electrical resistivity 2.48 μohm cm; in superconducting state.
44	847	L	1966	1.4-9.2	10	Nb I	The above specimen in normal state.
45	847	L	1966	1.3-9.0	10	Nb III DA	0.1 Ta, 0.01 Ti, 0.007 Fe, 0.005 Cu, 0.005 N, 0.005 O, 0.003 Na, 0.002 Al, 0.002 C, 0.002 Si, and 0.001 H; single crystal; 5.10 mm in dia and 21 mm long; made from polycrystalline sample of Pechiney; annealed at 1350 C in a vacuum of < 10^{-6} torr for 3 min; residual electrical resistivity 0.21 μohm cm; transition temp 9.25 K; in superconducting state.
46	847	L	1966	1.3-9.0	10	Nb III DA	The above specimen in normal state.

SPECIFICATION TABLE NO. 36 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
47	847	L	1966	1.3-8.8	10	Nb IV AA	Single crystal; 2.96 mm in dia and 21 mm long; supplied by Kuhlmann; annealed at 1320 C by electron bombardment for 15 min in a vacuum of $< 10^{-6}$ torr; residual electrical resistivity $\rho_0 = 0.38$ μohm cm; transition temp 9.25 K; in superconducting state.
48	847	L	1966	1.4-9.2	10	Nb IV AA	The above specimen in normal state.
49	847	L	1966	1.3-9.6	10	Nb IV B	Single crystal; 2.96 mm in dia and 21 mm long; supplied by Kuhlmann; obtained by fusion in a floating zone; residual electrical resitivity 0.22 μohm cm; transition temp 9.25 K; in superconducting state.
50	847	L	1966	1.5-9.9	10	Nb IV B	The above specimen in normal state.
51	848	E	1966	1400-2300	± 2		99.7 Nb + Ta, 0.17 Ta, 0.06 Si, 0.03 Fe, and 0.025 Ti; cylindrical specimen 65 mm long and 14 mm in dia finished to an "eighth-class" surface (max height of asperities 2.2 μ); preheated at 2000 to 2200 K for 4 hrs; density 8.56 g cm^{-3}; measured in a vacuum of 5×10^{-6} mm Hg.

REMARKS

The recommended values are for well-annealed 99.9⁺% pure niobium with residual electrical resistivity ρ_0 = 0.0975 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using $n = 2.00$, $\alpha' = 5.92 \times 10^{-4}$, and $\beta = 3.99$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature, and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are interpolated.

THERMAL CONDUCTIVITY OF OSMIUM

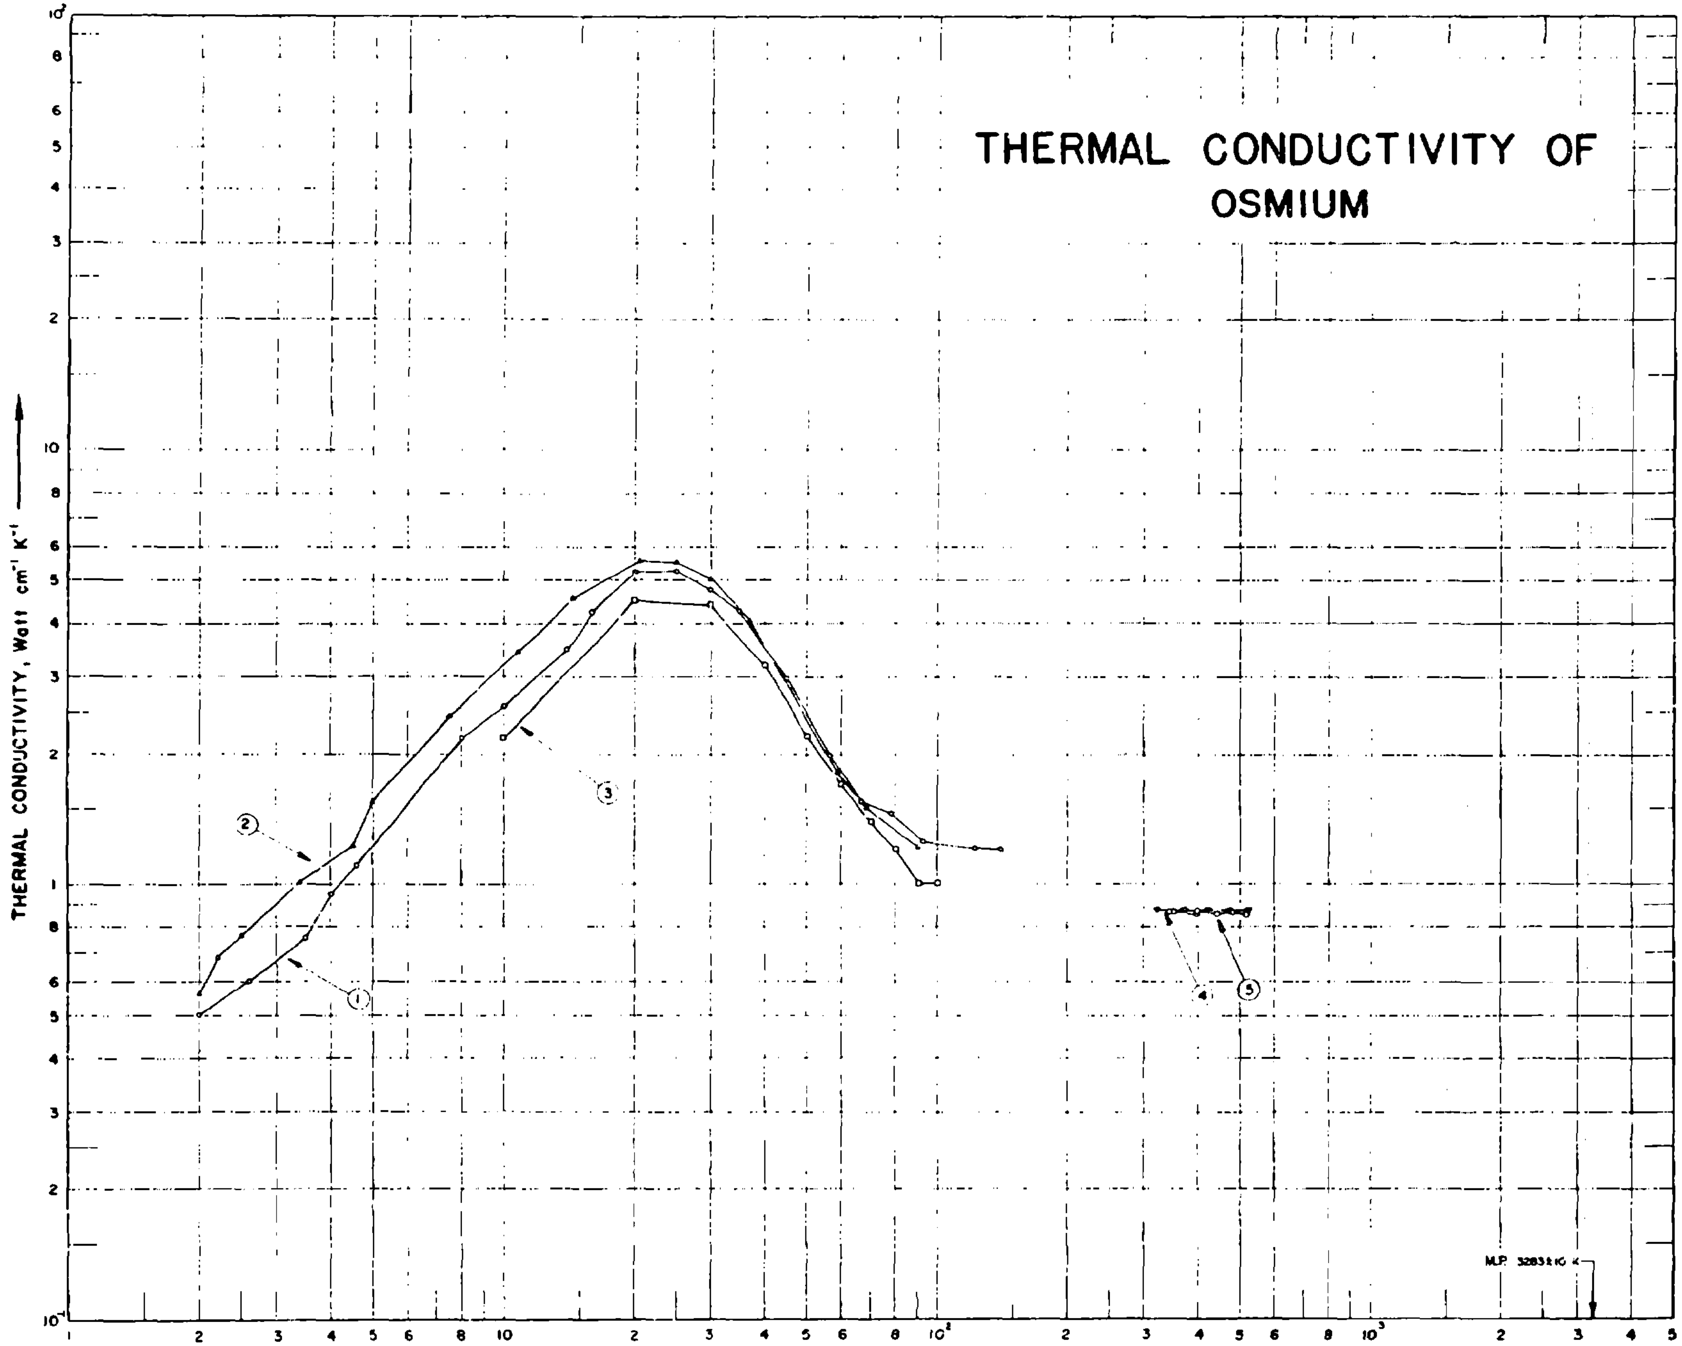

FIG 37

SPECIFICATION TABLE NO. 37 THERMAL CONDUCTIVITY OF OSMIUM

(Impurity < 0.20% each; total impurities 0.50%)

[For Data Reported in Figure and Table No. 37]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	384	L	1958	2.0-140		Os 2	99.995 pure; specimen 0.6 cm in dia and 6 cm long; powder supplied by Johnson Matthey and Mallory Ltd.; specimen prepared by arc-melting of pressed powder; residual electrical resistivity 0.10 μohm cm, electrical resistivity ratio $\rho(295K)/\rho_0 = 92.6$.
2	384	L	1958	2.0-91		Os 3	99.99 pure; specimen 0.188 cm in dia and 5 cm long; powder supplied by Baker Platinum Co.; specimen prepared by arc-melting of pressed powder; residual electrical resistivity 0.0872 μohm cm; electrical resistivity ratio $\rho(295K)/\rho_0 = 105.7$.
3	512	L	1957	10-100		Os 1	99.995 pure; powder supplied by Johnson Matthey Co.; specimen prepared by arc-melting of pressed powder in helium atmosphere; electrical resistivity ratio $\rho(295K)/\rho(4.2K) = 20.41$.
4	665	C	1962	323-523			0.0091 Ag, 0.0002 Cu, 0.0005 Fe, 0.002 Rh, and 0.03 Ru; specimen 0.489 cm in dia and 2.7 cm long; supplied by Johnson Matthey Co.; prepared by argon-arc melting and ground to size; density 22.45 g cm^{-3}; electrical resistivity 8.532 and 0.272 μohm cm at 273 and 4.2 K, respectively; electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 31.4$; data extracted from smooth curve.
5	249	C	1967	337-518			0.0001 Ag, 0.0002 Cu, 0.0005 Fe, 0.002 Rh, 0.03 Ru; polycrystalline; specimen 0.489 cm in dia and 2.7 cm long supplied by Johnson Matthey Co.; arc-melted and ground; annealed at 1820 K; density 22.45 g cm^{-3}, electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 33.3$ (the paper reported density as 12.45 g cm^{-3}, and the latter ratio as 22.45, apparently a typographical error. This has been confirmed by the author).

REMARKS

The recommended values are for well-annealed 99.99⁺% pure osmium with residual electrical resistivity ρ_0 = 0.0804 μΩ cm (characterization by ρ_0 becomes important at temperature below about 250 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 3.00, α' = 3.35 x 10^{-4}, and β = 3.29. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values at room and moderate temperatures and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$. ‡Values in parentheses are extrapolated or interpolated.

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	77	E	1900	291, 373			Pure; specimen 1.610 cm in dia and 27.0 cm long; cast; density 11.96 g cm^{-3} at 18 C.
2	97, 122	L	1952	2.4-31	2.0-3.0	Pd 1	99.995 pure; annealed polycrystal; specimen 0.152 cm in dia and 2.82 cm long; supplied by Johnson Matthey (No. 2134); electrical resistivity ratio $\rho(293K)/\rho(20K)$ = 34.1.
3	8	F	1914	290, 373			Commercially pure; specimen 0.1010 cm in dia and 35.1 cm long; supplied by Messr. Isenthal and Co.; electrical resistivity 17.815 and 18.532 μohm cm at 4.96 and 93.57 C, respectively.
4	8	L	1914	290, 373			Pure; specimen 0.0905 cm in dia and 35.2 cm long; electrical resistivity 10.334 and 13.497 μohm cm at 13.26 and 99.14 C, respectively.
5	82	L	1955	2.3-154		Pd 1	99.995 pure; traces of Ag, Ca, Cu, Si, and Mg; specimen 3 mm in dia; supplied by Johnson Matthey (JM2928); strained.
6	82	L	1955	2.3-150		Pd 2	The above specimen annealed in vacuo for about 4 hrs at 250 C.
7	82	L	1955	2.7-157		Pd 3	The above specimen annealed at 450 C for about 4 hrs.
8	82	L	1955	2.1-131		Pd 4	The above specimen annealed at 650 C for about 4 hrs.
9	82	L	1955	2.4-91		Pd 5	The above specimen annealed at 1000 C for about 4 hrs.
10	82	L	1955	2.2-24		Pd 6	The above specimen drawn to 2 mm dia, annealed at 450 C for about 4 hrs; electrical resistivity $1.82 \times 10^{-6} + 2.12 \times T^{3.2}$ ohm cm (the last term should have a factor 10^{-12}).
11	58	L	1934	79-91		Pd I	Medium pure; unannealed; residual electrical resistivity ρ_0 = 9.98 μohm cm.
12	58	L	1934	21, 22		Pd I	The above specimen measured after 5.5 months; residual electrical resistivity ρ_0 = 9.93 μohm cm.
13	58	L	1934	21-91		Pd II	Very pure; drawn and unannealed; residual electrical resistivity ρ_0 = 9.81 μohm cm.
14	58	L	1934	21-81		Pd II	The above specimen annealed for 2 hrs at 360 C; residual electrical resistivity ρ_0 = 9.77 μohm cm.
15	390	P	1956	375.2			Pure.
16	241	E	1911	298.2			Pure.
17	736	L	1965	0.42-0.92			Pure palladium.
18	665, 249	C	1962	314-502			0.005 Rh, 0.0005 Au, 0.0005 Fe, 0.0002 Pt, 0.0001 Cu, and < 0.0001 Ag; polycrystalline; specimen 0.636 cm in dia and 6.1 cm long supplied by Johnson Matthey Co.; density 12.02 g cm^{-3}; electrical resistivity 2.72, 7.05, 10.9, 14.5, and 17.9 μohm cm at 100, 200, 300, 400, and 500 K, respectively; $\rho(273K)/\rho(4.2K)$ = 69; Armco iron used as comparative material.

REMARKS

The recommended values are for well-annealed 99.995⁺% pure palladium with residual electrical resistivity ρ_0 = 0.0123 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, a = 0.40, m = 2.40, α'' = 1.54 x 10^{-4}, and β = 0.502. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $lb^{-1} ft^{-1} F^{-1}$. ‡Values in parentheses are extrapolated or interpolated.

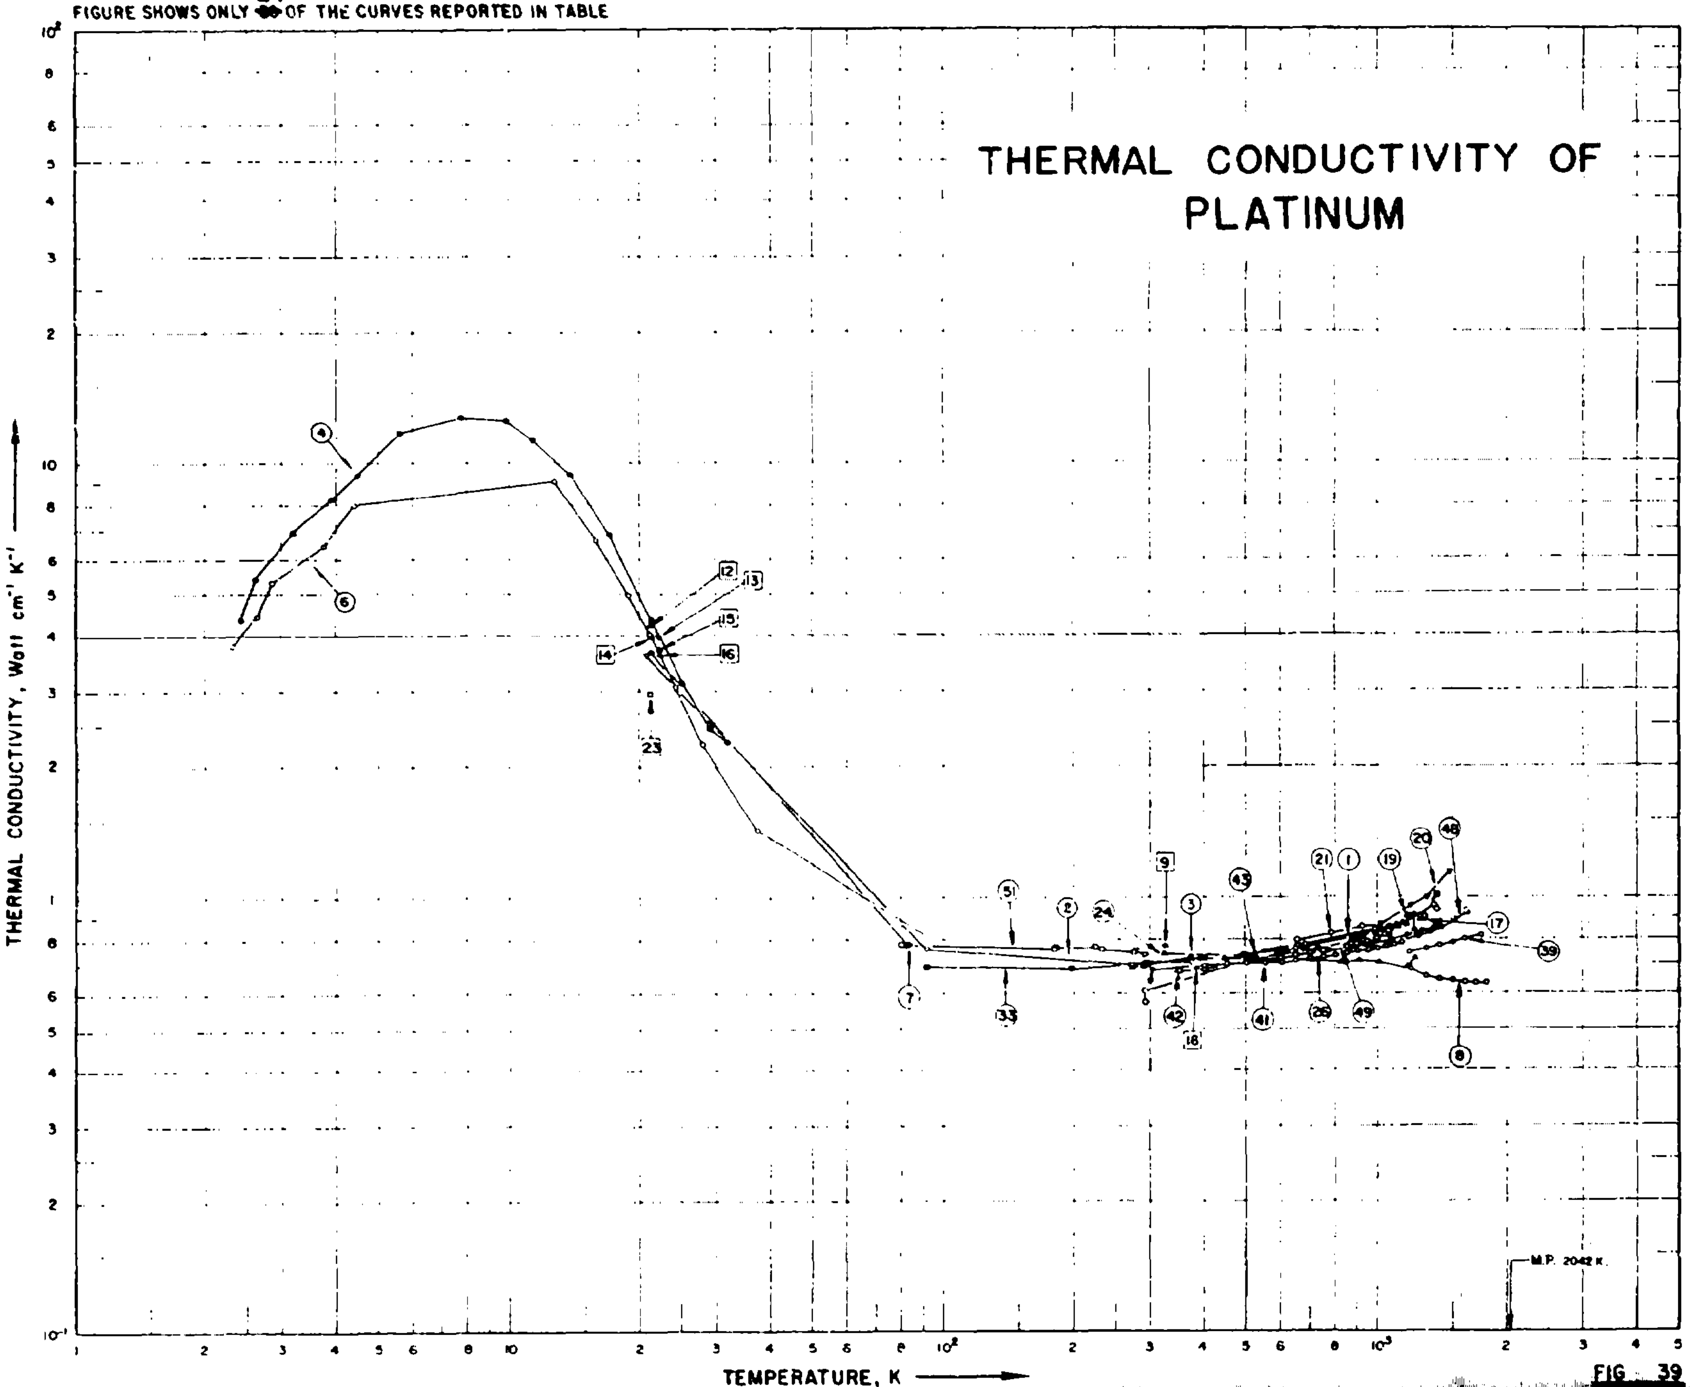

FIG. 39

SPECIFICATION TABLE NO. 39 THERMAL CONDUCTIVITY OF PLATINUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 39]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	70	E	1930	293-1293	3		99.95 pure; electrical resistivity data fitted into the equation $\rho = 10.48[1 + 3.695 \times 10^{-3} \times (T-15) - 5.98 \times 10^{-7} \times (T-15)^2 + 5.25 \times 10^{-11} \times (T-15)^3]$ μohm cm, T in C.
2	95	E	1915	21-374			Very high purity; drawn and electrically annealed; electrical conductivity 10.2 and 9.5 x 10^4 mho cm^{-1} at 278.1 and 291 K, respectively.
3	77	E	1900	291,373		Pt II	Pure; specimen 1.614 cm in dia and 27.0 cm long; density 21.39 g cm^{-3} at 18 C.
4	97, 122	L	1952	2.4-32	2-3	Pt I	99.999 pure; supplied by Johnson Matthey and Co. (JM 2157b); annealed wire; $\rho(293\ K)/\rho(20\ K) = 202$.
5	8	F	1914	273-373			Pure; electrical conductivity 10.24 and 7.35 x 10^4 mho cm^{-1} at 273 and 373 K, respectively.
6	143	L	1957	2.3-91			99.99⁺ pure; specimen 1.5 mm in dia; supplied by Baker Platinum Co.; annealed at 1050 C; $\rho(295\ K)/\rho_0 = 833$; residual electrical resistivity 0.0125 μohm cm.
7	57	L	1927	21,83		Pt III	Very pure; polycrystal; drawn and electrically annealed; electrical resistivity 0.0650, 2.10, and 9.81 μohm cm at -252, -190 and 0 C, respectively.
8	273	E	1954	1200-1800			Spectroscopically pure wire; obtained from Johnson Matthey and Co.
9	487	L	1894	326.2			Pure; specimen 2.0 mm in dia.
10	451	C	1930	291.2			Pure; tempered at 800 C and quenched, rolled and drawn; gold used as comparative material [k data 3.09 W $cm^{-1}K^{-1}$].
11	399	L	1925	290,373			Pure.
12	436	L	1938	21.17		Pt IV 33	Quasi-isotropic; electrical resistivity 0.0416 and 9.81 μohm cm at 21.38 and 273.2 K, respectively.
13	436	L	1938	22.01		Pt IV 33	The above specimen, second measurement.
14	436	L	1938	21.21		Pt IV 33	The above specimen measured at H = 8750 oersteds; electrical resistivity 0.04578 μohm cm at 21.38 K.
15	436	L	1938	22.10		Pt IV 33	The above specimen measured at H = 8750 oersteds.
16	436	L	1938	22.15		Pt IV 33	The above specimen measured at H = 12200 oersteds; electrical resistivity 0.04820 μohm cm at 21.38 K.
17	488	E	1929	293-1293	0.7-2.0		99.95 pure; electrical resistivity 10.65, 24.90, 35.01 and 43.61 μohm cm at 20, 412, 725, and 1020 C, respectively.
18	390	P	1956	384.2			Pure.
19	503	E	1961	1073-1223			99.9 chemically pure; specimen in the form of 0.1 mm dia wire stretched between two heaters; wire surface polished with Viennese chalk or Paris red (crocus, polishing powder); annealed at about 1000 C for 12 hrs.
20	599	E	1961	301-1473			99.9 pure; electrical resistivity 10.6 μohm cm at 23 C.
21	599	E	1961	292-1376			Similar to the above specimen.
22	241	L	1911	298.2			Less than 0.03 impurity.

SPECIFICATION TABLE NO. 39 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
23	57	L	1927	21.2		Pt IV	Pure; polycrystal; annealed; electrical resistivity 0.0899 and 9.83 μohm cm at 21.2 and 273.2 K, respectively.
24	665	C	1962	323, 523			0.0001 Cu, 0.0001 Fe, and <0.0001 Pd; specimen 0.635 cm in dia and 6.1 cm long; supplied by Johnson Matthey and Co.; annealed at approx 1000 C; density 21.51 g cm^{-3}; electrical resistivity 0.013 and 9.85 μohm cm at 4.2 and 273 K, respectively; 0.321 cm dia Armco iron rod used as comparative material; heat outflow also measured by water-flow calorimeter.
25	645	C	1963	315-503		Pt 1	0.0001 Cu, 0.0001 Fe, and < 0.0001 Pd; specimen 0.62 cm in dia and 6.1 cm in length; density 21.5 g cm^{-3}; machined; annealed at about 1000 C; 0.321 cm dia Armco iron rod used as comparative material; heat outflow also measured by water-flow calorimeter.
26	645	C	1963	445-1220		Pt 1	The above specimen; 0.371 cm dia Armco iron rod used as comparative material.
27	645	C	1963	787-1153		Pt 1	The above specimen; 1.273 cm dia Armco iron rod used as comparative material.
28	645	C	1963	760-1070		Pt 1	Same as above; reassembled.
29	645	C	1963	335-467		Pt 2	0.0001 Si, < 0.0001 Ag, < 0.0001 Ca, < 0.0001 Cu, 0.0001 Fe, < 0.0001 Mg, and < 0.0001 Pd; specimen 1.269 cm in dia and 10.16 cm in length; annealed at ~1000 C; density 21.5 g cm^{-3}; electrical resistivity (measured after all other tests) 9.9, 13.8, 17.4, 21.0, 24.5, 27.9, 31.1, 34.3, 37.3, 40.2, and 43.0 μohm cm at 0, 100, 200, 300, 400, 500, 600, 700, 800, 900, and 1000 C, respectively; Lorenz function at these temperatures being respectively 2.66, 2.70, 2.68, 2.67, 2.65, 2.64, 2.60, 2.57, 2.54, 2.51, and 2.47 x 10^{-8} V^2K^{-2}; 1.222 cm dia Armco iron rod used as comparative material; heat outflow also measured by water-flow calorimeter.
30	645	C	1963	357-800		Pt 2	Same as above but 1.9 cm dia Armco iron rod used as comparative material.
31	645	C	1963	575-1141		Pt 2	The above specimen; 0.371 cm dia Armco iron rod used as comparative material.
32	736	L	1965	0.43-0.82		Pt 2	Pure platinum wire.
33	847	E	1952	90-579			Wire 11.6 cm long and 1.5 mm dia.
34	662	L	1964	298-358	0.5		99.98 pure; ≈0.0030 Ir, 0.0021-0.0023 Ca, 0.0021-0.0023 Rh, 0.0015-0.0017 Al, 0.0015-0.0017 Pd, 0.0011 Au, 0.0007-0.0009 Mg, 0.0007-0.0009 Ag, and 0.0004-0.0005 Fe; specimen 5.0 cm in dia and 7.0 cm long; cast, cold-pressed and machined; density 21.32 g cm^{-3} at 20 C; held at 600 C for 2 hrs; first run. [0.004-0.006 Cu]
35	662	L	1964	294-349	0.5		The above specimen; second run.
36	662	L	1964	294, 365	0.5		The above specimen; third run.
37	662	L	1964	296-363	0.5		The above specimen; fourth run.
38	‡	L	1967	0.42-0.81	<1.0		99.999 pure; polycrystalline wire specimen; form factor ℓ/a = 7.74 x 10^3 cm^{-1}; obtained from Johnson and Matthey Co.; electrical resistivity 0.08004 μohm cm at 1.5 K; ρ(293 K)/ρ(1.5 K) = 148.

‡Sharma, J.K.N., Cryogenics, 1(3), 141-56, 1967.

SPECIFICATION TABLE NO. 39 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
39	654	P	1963	1180-1750			99.95 Pt sheet of 1 mm thickness; average grain size after test 1000 μ; density 21.5 g cm^{-3}; data calculated from thermal diffusivity measurements using the specific heat data of Kubaschewski, O. and Evans, L. Ll. (Metallurgical Thermochemistry, Pergamon Press, 1956).
40	624	E	1959	323-773			99.99 pure; polycrystal.
41	648, 993	P	1964	300-1150	±3	I	99.999 Pt, impurities (atomic %): 0.002 Pd, 0.001 Ir, 0.001 Ag, 0.001 Zn, 0.0006 Mo, 0.0006 Os, 0.0006 Ru, 0.0004 In, 0.0002 Re, 0.0002 W, 0.0001 Cu, 0.00007 Rh, and 0.00006 Ta; supplied by J. Bishop and Co.; ρ_{273K}/ρ_{4K} = 900; annealed at 1200 K for at least 1 hr; data calculated from thermal diffusivity data using a constant density of 21.37 g cm^{-3} and the specific heat data of Jaeger, F.M. and Rosenbohm, E. (Physica, 6, 1123-5, 1939).
42	648, 993	P	1964	300-1250	±3	II	99.9 Pt, impurities (atomic %): 0.35 Rh, 0.24 Ir, 0.05 Pd, 0.04 Ag, 0.034 Ru, 0.015 Cu, 0.006 Zn, 0.001 W, 0.0006 Ta, 0.0005 In, 0.0004 Re, 0.0001 Os, and < 0.0001 Mo; supplied by J. Bishop and Co.; ρ_{273K}/ρ_{4K} ~ 12; annealed at 1200 K for at least one hr; data calculated from thermal diffusivity data using a constant density of 21.37 g cm^{-3} and the specific heat data of Jaeger, F.M. and Rosenbohm, E. (Physica, 6, 1123-5, 1939).
43	689, 690	E	1965	273-1383	< 5		Platinum wire 0.3 mm in dia.
44	700, 993	P	1965	400-1200	±3	B	99.999 Pt (nominal), impurities (atomic %): 0.2 Pd, 0.06 Cu, 0.057 Rh, 0.01 Ag, 0.004 Zn, 0.001 Ir, 0.001 Ru, 0.0006 Os, 0.0002 Re, 0.0002 W, < 0.0001 Mo, 0.00007 Ta, and 0.00006 In; rod 0.1875 in. in dia and about 10 in. long; supplied by Engelhard Industries; annealed at 1200 K for at least one hr; electrical resistivity, 10.95, 14.75, 18.45, 22.10, 25.64, 29.00, 32.20, 35.35, and 38.45 μohm cm at 300, 400, 500, 600, 700, 800, 900, 1000, and 1100 K respectively and electrical resistivity ratio $\rho_{273K}/\rho_{4.2K}$ ~ 100 determined upon completion of the thermal diffusivity measurements; thermal conductivity values calculated from the thermal diffusivity measurements using a constant density of 21.37 g cm^{-3} from Smithsonian Physical Tables (1954) and also specific heat data of Jaeger and Rosenbohm (1939).
45	700, 993	P	1965	400-1200	±3	C	Data from a similar specimen having a nominal purity of 99.9; impurities (atomic %): 0.009 Rh, 0.006 Pd, 0.004 Ag, 0.003 Zn, 0.002 Cu, 0.001 Ir, 0.0006 W, 0.0005 In, 0.0004 Re, 0.0003 Os, < 0.0003 Mo, 0.0002 Ta, and < 0.0002 Ru; and electrical resistivity 11.30, 15.13, 18.90, 22.60, 26.14, 29.51, 32.76, 35.86, and 38.89 μohm cm at 300, 400, 500, 600, 700, 800, 900, 1000, and 1100 K respectively; $\rho_{273K}/\rho_{4.2K}$ ~ 34.

SPECIFICATION TABLE NO. 39 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
46	700, 993	P	1965	400-1200	±3	D	Data from another specimen having a nominal purity of 99.999; impurities (atomic %): 0.002 Zn, 0.001 Cu, 0.001 In, 0.001 Ir, 0.001 Pd, 0.001 Ag, 0.0006 Mo, 0.0006 Os, 0.0006 Ru, 0.0002 Re, 0.0002 W, 0.00007 Rh, and 0.00006 Ta; from Sigmund Cohn Corp. with a corresponding electrical resistivity of 10.90, 14.68, 18.40, 21.98, 25.45, 28.82, 32.04, 35.10, and 38.13 μohm cm at 300, 400, 500, 600, 700, 800, 900, 1000, and 1100 K, respectively; $\rho_{273K}/\rho_{4.2K} \sim 5000$.
47	507	L	1966	300-1000	±1.7		99.999 Pt, 0.0004 Rh, 0.0003 Fe; specimen 1.2 cm in dia and 10 cm long; supplied by Engelhard Industries, Inc., Newark, New Jersey; machined from a special lot of platinum.
48	878	P	1966	970-1611			Nominal purity 99.9, following percentages are upper limits: 0.1 Ag, 0.2 Au, 0.01 Cr, 0.1 Cu, 0.1 Fe, 0.01 Mn, 0.01 Ni, 0.1 Pd, 0.2 Rh, 0.2 Ru, 0.1 Si; specimen 0.479 cm in dia and 15 cm long; supplied by Engelhard Inc.; electrical resistivities from smoothed curve of author's measurements: 34.54, 35.68, 37.90, 40.06, 42.60, 45.01, 46.89, 49.75, and 52.28 μohm cm at 970, 1006, 1078, 1153, 1243, 1331, 1402, 1511, and 1611 K respectively; thermal conductivity values calculated from the thermal diffusivity measurements using a constant density 21.37 g cm^{-3} from Forsythe, W.E. (Smithsonian Physical Tables, 9th revised ed.) and the specific heat data of Jaeger, F.M. and Rosenbohm, E. (Physica 6, 1123, 1939).
49	879, 991, 1000	L	1966	373-1373			99.987 pure; density 21.384 ± 0.002 g cm^{-3} at 21 C, ice point resistivity 9.847 ± 0.01 μohm cm (corrected to 0 C dimensions); Vickers Hardness Number subsequent to annealing 37.
50	879, 991	E	1966	373-1373			The above specimen measured by different method.
51	249	C	1967	80-294		Platinum I	0.0001 Cu, 0.0001 Fe, <0.0001 Pd; polycrystalline specimen 0.635 cm in dia and 6.1 cm long; supplied by Johnson, Matthey and Co., annealed at 1273 K; density 21.51 g cm^{-3}, electrical resistivity ratio $\rho_{273K}/\rho_{4.2K} = 740$.
52	249	C	1967	300-500		Platinum II	0.0001 each of Fe and Si, < 0.0001 each of Hg, Cu, Pd, Ca, and Mg; polycrystalline; specimen 1.269 cm in dia and 10.16 cm, long; supplied by Johnson, Matthey and Co., annealed at 1250 K; density 21.5 g cm^{-3}.
53	989	E	1947	195-373			Wire specimen 1.438 ± 0.003 mm in dia; measured in a vacuum of $<10^{-5}$ mm Hg.

REMARKS

The recommended values are for well-annealed 99.999+% pure platinum with residual electrical resistivity ρ_0 = 0.0106 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.10, α' = 3.01 x 10^{-4}, and β = 0.433. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ *Values in parentheses are extrapolated.*

SPECIFICATION TABLE NO. 40 THERMAL CONDUCTIVITY OF PLUTONIUM

(Impurity <0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 40]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	921, 373	L	1957	108-413		1	99.95 pure; isotopic content: 94.76 Pu-239, 4.91 Pu-240, 0.29 Pu-241 and 0.04 Pu-242; specimen 0.231 in. in dia and 3.50 in. long; heat generation 0.01067 cal sec^{-1}cm^{-3}; density 19.58 g cm^{-3}; phase transformation (α to β) at 397.0 ± 0.2 K; electrical resistivity 61.1, 128.0, 157.0, 153.5, 146.3, 141.0, 107.5, 107.0, 106.2, 105.0, 97.7, 98.5, 99.4, and 107.1 μohm cm at 27.2, 50, 100, 150, 273, 380, 420, 475, 505, 590, 625, 725, 735, and 774 K, respectively.
2	921, 373	L	1957	152-413		2	99.97 pure; isotopic content: 95.35 Pu 239, 4.37 Pu-240, 0.26 Pu-241 and 0.03 Pu 242; specimen 0.250 in. in dia and 3.50 in. long; heat generation 0.01034 cal sec^{-1}cm^{-3}; density 19.56 g cm^{-3}; phase transformation (α to β) at 396.4 ± 0.1 K; electrical resistivity 68.5, 128.0, 156.8, 153.5, 146.6, 141.8, 109.5, 110.0, 109.5, 109.3, 103.0, 104.0, 104.8, 114.0, and 114.1 μohm cm at 25.8, 50, 100, 150, 273, 380, 420, 475, 505, 590, 625, 725, 735, 774, and 787 K, respectively.
3	921, 373	L	1957	148-413		3	99.93 pure; isotopic content: 95.33 Pu-239, 4.39 Pu-240, 0.28 Pu-241 and 0.06 Pu-242; specimen 0.227 in. in dia and 3.75 in. long; heat generation 0.01034 (assumed) cal sec^{-1}cm^{-3}; density 19.53 g cm^{-3}.
4	767	L	1958	309-357	5		Impurities 0.025; α-phase; specimen 1 in. in dia and 5 in. long; zone refined; self heating used as source of power during measurement; data extracted from two runs.
5	767	E	1958	309-374	1.5		Impurities 0.025; α-phase; 1.6 in. long; 0.08 in. dia; zone refined; cast.
6	767	E	1958	309-374			The above specimen, data corrected for emissivity (assumed to be 0.3).
7	281	E	1967	62-300	1	α-Plutonium	99.98$^+$ pure; monoclinic crystalline; specimen 0.25 in. in dia and 1.81 in. long; arc-melted and induction cast into an MgO mold; density 19.62 g cm^{-3}; specimen had randomly oriented grains and a large number of microcracks.
8	281	E	1967	80-300	1	α-Plutonium	99.98$^+$ pure; monoclinic crystalline; specimen 0.25 in. in dia and 1.81 in. long; arc-melted and cast into a mold at -40 C, then annealed at 110 C; density 19.77 g cm^{-3}; specimen had randomly oriented grains and very few microcracks.
9	281	E	1967	80-300	1	α-Plutonium	99.98$^+$ pure; specimen 0.25 in. in dia and 1.80 in. long with long axis parallel to preferential alignment of the (020) plane in the monoclinic crystals; prepared by heating the cast ingot into the beta-phase temperature range and then cooling it to room temperature under a compressive load of 60,000 psi; density 19.77 g cm^{-3}.
10	281	E	1967	80-300	1	α-Plutonium	Similar to the above specimen except the long axis aligned perpendicular to the (020) plane of the monoclinic crystal.

350	0.0790	4.56	170.3

REMARKS

The recommended values are for well-annealed 99.98% pure plutonium. The recommended values are thought to be accurate to within 10% of the true values near room temperature and 10 to 20% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

SPECIFICATION TABLE NO. 41 THERMAL CONDUCTIVITY OF POTASSIUM

(Impurity < 0.20% each; total impurities < 0.5%)

[For Data Reported in Figure and Table No. 41]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	105	P	1956	384-891			Pure; in liquid state; thermal conductivity values calculated from measured (in argon) thermal diffusivity data using the specific heat and density values given in Liquid Metals Handbook (Lyon, R., Editor), 2nd Edition, 1952.
2	502,38	L	1951	448-883	1		< 0.001 O, < 0.00001 each of Na, Ca, Al, Rb, and Li; distilled; in liquid state.
3	72	E	1913	278-331			Pure; trace of Na; supplied by Eimer and Amend; electrical resistivity reported as 6.492, 6.442, 7.015, 7.035, 6.980, 8.353, and 8.338 μohm cm at 5.0, 5.0, 20.6, 20.7, 20.9, 57.4, and 57.8 C, respectively.
4	92	L	1956	2.4-13		K 1	Very pure; 1.3 mm dia; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 532 (using Hackspill's value ρ(295 K) = 7.08 μohm cm); Lorenz function L (0 K) = 2.55 x $10^{-8} V^2 K^{-2}$.
5	92	L	1956	2.3-91		K 2	Very pure; 2.1 mm dia; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 513 (using Hackspill's value ρ(295 K) = 7.08 μ ohm cm); Lorenz function L (0 K) = 2.31 x $10^{-8} V^2 K^{-2}$.
6	92	L	1956	2.6-18		K 4	Very pure; 1.3 mm dia; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 325 (using Hackspill's value ρ(295 K) = 7.08 μohm cm); Lorenz function L (0 K) = 2.49 x $10^{-8} V^2 K^{-2}$.
7	385	L	1940	298-433	2-4		Doubly distilled; measured across melting point (approx 62 C).
8	919, 592,920	L	1958	382-1007			M.P. 63.7 C; specimen in liquid state; measured in vacuum of ~ 4 x 10^{-4} mm Hg.
9	766	C	1963	319,333			0.1 Na, 0.0050 Rb, 0.0035 O, 0.0030 Li, < 0.0010 each of Cs, Zr, Fe, Co, and Ni; Nb-1 Zr alloy used as comparative material.
10	766,854, 855,856	C	1963	360-449			Liquid state; same pretest impurities as the above specimen; additional impurities after test: 0.00105 Nb and 0.00015 Zr (contaminated from specimen container, made from Nb-1 Zr alloy); electrical resistivity reported as 15.4, 21.5, 28.4, 35.8, 44.4, 54.7, 66.4, 79.5, 93.8, 110, 131, 145, and 153 μ ohm cm at 373, 473, 573, 673, 773, 873, 973, 1073, 1173, 1273, 1373, 1423, and 1448 K, respectively; Nb-1 Zr alloy used as comparative material; run A, equilibrium 1.
11	766,854, 855,856	C	1963	408-511			Run A, equilibrium 2 of the above specimen.
12	766,854, 855,856	C	1963	412-501			Run A, equilibrium 3 of the above specimen.
13	766,854, 855,856	C	1963	491-658			Run A, equilibrium 4 of the above specimen.
14	766,854, 855,856	C	1963	529-787			Run A, equilibrium 5 of the above specimen.
15	766,854, 855,856	C	1963	584-953			Run A, equilibrium 6 of the above specimen.
16	766,854, 855,856	C	1963	611-1054			Run A, equilibrium 7 of the above specimen.

SPECIFICATION TABLE NO. 41 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
17	766, 854, 855, 856	C	1963	604-822			Same specimen as above; run B, equilibrium 1.
18	766, 854, 855, 856	C	1963	745-897			Run B, equilibrium 2 of the above specimen.
19	766, 854, 855, 856	C	1963	922-1154			Run B, data set 3, reading 1 of the above specimen.
20	766, 854, 855, 856	C	1963	970-1210			Run B, data set 3, reading 2 of the above specimen.
21	766, 854, 855, 856	C	1963	1219-1435			Run B, data set 3, reading 14 of the above specimen.
22	766, 854, 855, 856	C	1963	1234-1449			Run B, data set 3, reading 15 of the above specimen.
23	148, 857		1966	700-1500	± 30		Vapor; measured in the 1 mm gap between concentric cylinders 900 mm long; vapor pressure = 0.01 kg cm^{-2}.
24	148, 857		1966	800-1500	± 20		Similar to the above except vapor pressure = 0.05 kg cm^{-2}.
25	148, 857		1966	900-1500	± 20		Similar to the above except vapor pressure = 0.1 kg cm^{-2}.
26	148, 857		1966	1000-1500	± 20		Similar to the above except vapor pressure = 0.5 kg cm^{-2}.
27	148, 857		1966	1100-1500	± 20		Similar to the above except vapor pressure = 1.0 kg cm^{-2}.
28	148, 857		1966	1100-1500	± 20		Similar to the above except vapor pressure = 2.0 kg cm^{-2}.
29	148, 857		1966	700-1100	± 20		Similar to the above except measured on saturate curve.
30	858	L	1967	4.3-18	?	K-9	99.97 pure; single crystal; rectangular specimen with length/cross-sectional area = 12; material obtained from Mine Safety Appliances Corp.; prepared by growing from the bulk material using the Bridgman technique.
31	858	L	1967	3.1-32	?	ZK-1	Originally 99.97 pure; single crystal; rectangular specimen with length to cross-sectional area ratio = 12; material obtained from Mine Safety Appliances Corp.; prepared by melting in a stainless-steel boat, zone refined at a rate of 1 in. hr^{-1} for 16 passes, grown by using the Bridgman technique. The zone refining technique is believed to have introduced impurities not present in the original bulk material.
32	858	L	1967	2.7-12	?	ZK-2	Similar to the above specimen
33	859, 860, 861	-	1965	341-1366			Specimen in liquid state; density reported as 0.7851, 0.7434, 0.7161, 0.6887, 0.6664, 0.6276, 0.6024, and 0.5861 g cm^{-3} at 520.5, 701.3, 827.7, 944.3, 1048, 1206, 1302, and 1374 K, respectively; electrical resistivity reported as 7.02, 7.32, 7.54, 8.05, 15.05, 17.96, 20.31, 24.83, 28.34, 32.64, 37.84, 41.43, 47.70, 51.81, 58.51, 65.94, 71.44, 81.18, 87.82, 98.61, 106.63, 119.87, and 130.61 μohm at 296, 309, 314, 329, 376, 431, 476, 541, 591, 648, 712, 755, 822, 863, 926, 988, 1031, 1102, 1144, 1210, 1253, 1319 and 1365 K, respectively; thermal conductivity values calculated from measured electrical resistivity data and the Lorenz number 2.45 x 10^{-8} V^2K^{-2}.

SPECIFICATION TABLE NO. 41 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
34	766, 855	-	1963	373-1423	< ± 2		Thermal conductivity values calculated from the measurements of electrical resistivity, reported as 15.4, 21.5, 28.4, 35.8, 44.4, 54.7, 66.4, 74.2, 79.5, 93.8, 110, 131, and 145 μ ohm cm at 100, 200, 300, 400, 500, 600, 700, 760, 800, 900, 1000, 1100, and 1150 C, respectively; Lorenz Number assumed to be 2.14 x 10^{-8} V^2K^{-2} based upon experimental information.
35	863	-	1966	845.2		Run No. 1	Vapor specimen filled in a test cell 8 in. long connected with a boiler; boiler pressure ~ 10 mm Hg; thermal conductivity measured by using the dynamic hot-wire method.
36	863	-	1966	847.2		Run No. 2	Same as above except boiler pressure 37 mm Hg.
37	863	-	1966	914.2		Run No. 3	Same as above except boiler pressure 72 mm Hg.
38	863	-	1966	978.2		Run No. 4	Same as above except boiler pressure 80 mm Hg.
39	863	-	1966	983.2		Run No. 5	Same as above; in different run.
40	863	-	1966	1034		Run No. 6	Same as above except boiler pressure 78 mm Hg.
41	863	-	1966	1035		Run No. 7	Same as above except boiler pressure 1417 mm Hg.
42	863	-	1966	1036		Run No. 8	Same as above; in different run.
43	863	-	1966	1116		Run No. 9	Same as above except boiler pressure 1144 mm Hg.
44	756	-	1962	473-1073			0.32 Na, 0.02 Fe, and 0.004 O (posttest); molten specimen contained in a type 347 stainless-steel tube; supplied by Fisher Scientific Co.; electrical resistivity 8.07, 8.24, 8.59, 8.82, 9.47, 9.81, 14.77, 15.48, 17.90, 21.86, 26.06, 29.57, 34.11, 38.32, 43.30, 48.47, 54.04, 59.47, 60.02, 66.75, and 74.30 μohm cm at 25.3, 29.4, 38.3, 51.4, 58.3, 59.2, 79.4, 91.9, 140.8, 205.0, 256.4, 313.9, 373.6, 429.2, 481.9, 542.8, 593.3, 646.9, 651.4, 706.7, and 764.2 C, respectively; thermal conductivity values calculated from measured electrical resistivity data and the Lorenz function of 2.07, 2.11, 2.14, 2.17, 2.21, 2.29, and 2.34 x 10^{-8} V^2K^{-2} at 200, 300, 400, 500, 600, 700, and 750 C, respectively, the first five values being derived from the thermal conductivity measurements of Ewing, C.T. and Grand, J.A. (NRL Report 3835, 1951) and the authors' own electrical resistivity data.

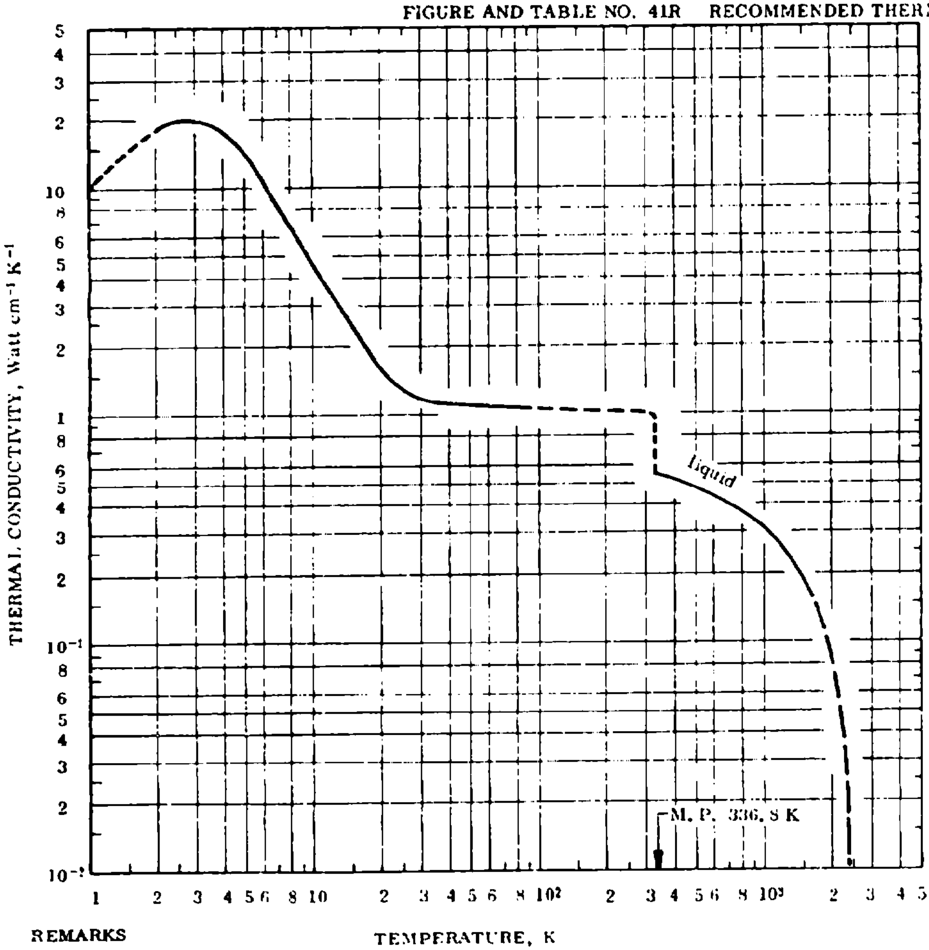
FIGURE AND TABLE NO. 41R RECOMMENDED THERMAL CONDUCTIVITY OF POTASSIUM



REMARKS

The recommended values are for 99.97+% pure potassium with residual electrical resistivity $\rho_0 = 0.00237\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 80 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, $\alpha' = 2.06 \times 10^{-3}$, and $\beta = 0.0973$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	999	–	1966	300-1353			Solid state; estimated thermal conductivity values given as the sum of electronic thermal conductivity and lattice thermal conductivity where electronic thermal conductivity values calculated from the theoretical Lorenz number $L_0 = 2.443 \times 10^{-8}\ V^2K^{-2}$ and the estimated electrical resistivity reported as 54.0, 68.0, 80.0, 92.0, 102.0, 111.5, 120.5, 128.0, 134.5, 139.0 (α), 146.0 (β), 149.0, and 152.0 μohm cm at 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1185, 1185, 1300, and 1353 K, respectively, and lattice thermal conductivity calculated from the empirical equation $k_L = 16\ T^{-1}$; c.p.h. to b.c.c. transformation temp estimated to be 1185 K; Neel temp estimated to be 6 K.
2	999	–	1966	1353-2253			Liquid state; estimated thermal conductivity values given as the sum of electronic thermal conductivity and phonon conductivity where electronic thermal conductivity values calculated from estimated values of Lorenz number, and electrical resistivity, whereas phonon conductivity values ranging from 0.004 to 0.012 W cm^{-1} C^{-1} being based on predictions due to Rao, M.R. (Phys. Rev., 59, 212, 1941), Turnbull, A.G. (Aust. J. Appl. Sci., 12, 324-29, 1961) and Powell, R.W. (Amer. Soc. Mech. Engrs., 289-95, 1965); approx mean conductivity values given by $k = 0.110 + 6.0 \times 10^{-5} T(C)$ W cm^{-1} C^{-1}.

SPECIFICATION TABLE NO. 44 THERMAL CONDUCTIVITY OF RHENIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 44]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	150	L	1957	2.6-118		Re 1	99.5+ Re, total metallic impurities < 0.1, consisting of Cu, Fe, and Mo; cut from a rolled sheet 0.75 mm thick supplied by A.D. Mackay Inc.; density 21.3 g cm^{-3} at room temp; residual electrical resistivity 0.87 μohm cm; electrical resistivity ratio $\rho(295K)/\rho_0$ = 24.9.
2	150	L	1957	2.1-112		Re 2	Cut from the same sheet as the above specimen; annealed in vacuo at 700 C for 2 hrs; residual electrical resistivity 0.469 μohm cm; electrical resistivity ratio $\rho(295K)/\rho_0$ = 40.7.
3	150	L	1957	2.1-92		Re 4	Total impurities < 0.01; prepared by zone-melting rhenium powder in an argon arc furnace; 6 mm dia x 5-8 cm long; residual electrical resistivity 0.0139 μohm cm; electrical resistivity ratio $\rho(295K)/\rho_0$ = 1357.
4	667	E	1962	1700-2650	10		Spectrographically pure; 0.10 in. dia; electrical resistivity reported as 75.2, 84.9, 92.0, 95.2, 100.0, 103.9, 106.5, 108.3, 109.5, and 110.1 μohm cm at 1130, 1410, 1630, 1815, 1975, 2115, 2250, 2370, 2495, and 2605 K, respectively; measured in a vacuum of < 10^{-5} mm Hg.
5	610	L	1963	83-373			High purity; traces of noble metals; 7.0 cm long, 0.486 cm in dia; supplied by Johnson Matthey Co.; heat treated at 1390 C; electrical resistivity reported as 2.9, 5.8, 9.6, 13.3, 17.2, 18.8, 21.2, 24.9, 28.8, 32.6, and 36.1 μohm cm at 83, 123, 173, 223, 273, 293, 323, 373, 423, 473, and 523 K; residual electrical resistivity 0.078 μohm cm; density 20.98 g cm^{-3}; data taken from smooth curve.
6	610	C	1963	423-523			The above specimen measured by comparative method using Armco iron as comparative material; data taken from smoothed curve.
7	849	--	1966	1577-2397			0.0047 C and 0.001116 O; hexagonal; specimen 1.0711 cm in dia and 0.1582 cm thick; density 20.97 g cm^{-3}; thermal conductivity derived from the temp distribution on the flat surface of the cylindrical disc specimen heated in high vacuum (10^{-5} mm Hg) by high frequency induction generating localized heating within 0.005 in. of the surface at current frequency of 500,000 cps with heat lost only be radiation; the cylindrical surface being assumed isothermal, and the temp gradient along the radius was analytically correlated to the thermal conductivity.

REMARKS

The recommended values are for well-annealed 99.99% pure rhenium with residual electrical resistivity $\rho_0 = 0.0140\ \mu\Omega$ cm *(characterization by ρ_0 becomes important at temperatures below about 200 K)*. The values below 1.5 T_m are calculated to fit the experimental data by using $n = 2.50$, $\alpha' = 4.56 \times 10^{-5}$, and $\beta = 0.570$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

---

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}. ‡Values in parentheses are extrapolated or interpolated.

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	97	L	1952	2.2-21		JM 2357; Rh 1	99.995 pure; 1-2 mm dia x 5 cm long; supplied by Johnson Matthey.
2	8	F	1914	290, 373			Pure; 0.1030 x 0.1030 x 10.0 cm; electrical resistivity reported as 4.811 and 6.211 μohm cm at 0 and 100 C, respectively; specific gravity 12.505.
3	149	L	1957	6.1-91		Rh 1	99.9⁺ pure; 1.5 mm dia; supplied by Baker Platinum Co.; annealed at 1050 C; residual electrical resistivity 0.44 μohm cm; electrical resistivity ratio $\rho(295K)/\rho(0K) = 12$.
4	149	L	1957	2.3-116		JM 8208; Rh 2	99.997⁺ Rh, 0.002 Fe, and 0.0005 Cu; 1.5 mm dia; supplied by Johnson Matthey; annealed at 1300 C; ideal electrical resistivity reported as 0.00075, 0.0022, 0.0124, 0.048, 0.107, 0.42, 0.87, 1.91, 2.93, 4.33, 4.78, and 5.8 μohm cm at 15, 20, 30, 40, 50, 75, 100, 150, 200, 273, 295, and 350 K, respectively; residual electrical resistivity 0.0084 μohm cm; electrical resistivity ratio $\rho(295 K)/\rho(0 K) = 570$.
5	57	L	1927	21, 83			Pure; supplied by Heraeus; rolled into square wire; annealed in vacuum at 1030 C for 10 min; electrical resistivity reported as 0.01635, 0.595, and 4.58 μohm cm at 21.2, 83.2, and 273.2 K, respectively.
6	253	L	1959	2.1-111		1	Specimen 7.5 x 0.15 x 0.15 cm; made from the specimen used by Gruneisen and Goens, 1927; electrical resistivity reported as 0.0155, 0.0160, 0.0167, 0.0188, 0.0318, 0.0581, 0.170, 0.380, 0.524, 0.751, 1.178, and 5.043 μohm cm at 4.2, 14.3, 18.7, 23.2, 32.9, 40.8, 54.7, 70.1, 78.8, 90.2, 110.6, and 292.3 K, respectively.
7	253	L	1959	4.1-90		2	Same source as the above specimen; dimensions 3.4 x 0.15 x 0.15 cm; annealed in vacuum at 1400 C for 5 hrs and cooled slowly; residual electrical resistivity 0.0148 μohm cm.
8	411	L	1955	86-282			0.03-0.1 Ir, 0.005 Fe, 0.002-0.005 Ag, and 0.001-0.003 Pd; 5 cm long, 0.349 cm dia; supplied by Johnson Matthey Co.; annealed in vacuum at 1326 C; density 12.45 g cm⁻³; electrical resistivity reported as 0.63, 0.765, 0.86, 1.02, 1.16, 1.265, 1.34, 2.95, 2.99, 3.155, 4.44, and 4.51 μohm cm at 85.8, 92.4, 97.1, 104.9, 112.2, 117.6, 121.6, 202.6, 204.8, 213.8, 277.8, and 281.6 K, respectively.
9	665	C	1962	323-458			The above specimen measured by comparative method using Armco iron as comparative material; residual electrical resistivity 0.024 μohm cm; electrical resistivity ratio $\rho(273K)/\rho_0 = 182$.
10	249	L	1967	84-282		Rh 1	0.03-0.1 Ir, 0.005 Fe, 0.002-0.005 Ag, and 0.001-0.003 Pd; specimen 0.348 cm in dia and 5 cm long supplied by Johnson Matthey Co.; annealed at 1610 K; density 12.44 g cm⁻³; electrical resistivity reported as 0.92, 2.9, 4.90, 6.95, and 9.15 μohm cm at 100, 200, 300, 400, and 500 K, respectively; electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 180$.
11	249	C	1967	318-591		Rh 1	The above specimen measured by comparative method using Armco iron as comparative material.
12	249	C	1967	310-521		Rh 2	0.001 Fe, 0.0002 Ag, 0.0001 Cu, and 0.0001 Pd; specimen 0.6 cm in dia, 6 cm long; supplied by Johnson Matthey and Co.; density 12.22 g cm⁻³; electrical resistivity reported as 0.9, 2.95, 4.95, 7.05, and 9.22 μohm cm at 100, 200, 300, 400, and 500 K, respectively; electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 233$.

REMARKS

The recommended values are for well-annealed 99.99% pure rhodium with residual electrical resistivity $\rho_0 = 0.00840\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values below 1.5 T_m are calculated to fit the experimental data by using $n = 2.70$, $\alpha' = 3.16 \times 10^{-6}$, and $\beta = 0.344$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or estimated.

[For Data Reported in Figure and Table No. 46]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	92	L	1956	2.0-70		Rb 1	High purity; 1.65 mm dia; supplied by A.D. MacKay (New York); electrical resistivity ratio $\rho(295\ K)/\rho(0\ K)$ = 380 (using electrical resistivity ρ(295 K) = 14.6 μ ohm cm).
2	385	L	1940	281-361			Supplied by Ukraine Chemical Institute of Odessa; specific resistance 35% greater than that of pure Rb; M.P. 8 C lower than that of pure Rb.
3	655	-	1964	367-1370			99.5 pure; electrical resistivity measured in argon and reported as 11.28, 12.51, 26.55, 30.12, 30.88, 32.82, 35.39, 35.90, 40.56, 42.70, 47.03, 47.48, 54.49, 58.01, 60.70, 69.82, 77.47, 85.30, 86.05, 96.59, 105.82, 117.59, 129.96, 144.17, 144.27, 159.55, 174.96, 196.97, and 197.36 μ ohm cm at 273.2, 302.6, 366.5, 414.3, 418.7, 442.1, 469.3, 482.6, 524.3, 547.1, 592.1, 595.4, 643.7, 691.5, 734.8, 790.9, 848.7, 901.5, 903.7, 969.3, 1020.9, 1076.5, 1135.4, 1190.9, 1195.4, 1249.8, 1303.7, 1367.6, and 1369.8 K, respectively; thermal conductivity values calculated from electrical resistivity data using theoretical Lorenz number 2.45 x 10^{-8} V^2K^{-2}.
4	882	-	1967	822-969			Specimen in vapor state, measuring method based on the study of laminar flow in a long tube with a constant wall temperature, combined with the heat exchange theory; data calculated from the measured temperature and flow rate and the specific heat of the vapor which was obtained from Achener, P.Y., et al., (USAEC Rept. AGN-8192, 1967).
5	881		1962	944-1121			Vapor Rubidium specimen; atomic dia σ = 12.7 Å; thermal conductivity data estimated.
6	756	-	1962	312-1025			0.32 Cs, 0.06 K, and 0.05 Na; composition after testing, 0.39 Cs, 0.13 Na, 0.11 K, 0.03 Ca, 0.008 Fe, 0.005 O, 0.002 Ni, < 0.001 each of Cr and Li; molten specimen contained in a type 347 stainless-steel tube; supplied by American Potash and Chemical Corp.; electrical resistivity reported as 13.85, 14.67, 22.84, 22.93, 23.35, 25.96, 31.62, 37.06, 42.30, 46.59, 46.61, 52.45, 58.01, 59.37, 64.61, 71.48, 72.49, 81.06, 91.29, 99.05, and 109.31 μ ohm cm at 25.6, 37.5, 39.2, 41.7, 46.4, 91.7, 146.7, 204.2, 260.3, 308.3, 309.4, 361.7, 412.5, 426.1, 463.1, 520.3, 528.9, 581.7, 650.1, 697.2, and 751.7 C, respectively; thermal conductivity values calculated from measured electrical resistivity data and the theoretical Lorenz number 2.45 x 10^{-8} V^2K^{-2}.

REMARKS

The recommended values are for high-purity rubidium with residual electrical resistivity $\rho_0 = 0.0368\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 70 K). The values below 1.5 T_m are calculated to fit the experimental data by using $n = 2.00$, $\alpha' = 0.0093$, and $\beta = 1.50$. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated, interpolated, or estimated.

REMARKS

The recommended values are for well-annealed 99.995+% pure ruthenium with residual electrical resistivity ρ_0 = 0.00860 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 250 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 3.10, a = 2.5, m = 5.60, α' = 3.91 x 10^{10}, and β = 0.705. The recommended values are thought to be accurate to within 4% of the true values near room temperature and 4 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡Values in parentheses are extrapolated.

REMARKS

The recommended values are for well-annealed high-purity scandium with residual electrical resistivity $\rho_0 = 10.6\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 250 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

---

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 50 THERMAL CONDUCTIVITY OF SELENIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 50]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	357	L	1943	301, 319	< 1.8		Pure.
2	358	L	1957	300.7	< 4		99.996 pure; vitreous and amorphous; specimen 20 mm in dia; polished.
3	358	L	1957	300.7	< 4		0.065 Br; same structure and dimensions as the above specimen; prepared by fusion in a molybdenum crucible, solidified and polished.
4	358	L	1957	300.7	< 4		0.13 Br; same structure, dimensions, and fabrication method as above.
5	358	L	1957	300.7	< 4		0.16 Br; same structure, dimensions, and fabrication method as above.
6	358	L	1957	293.2	< 4		99.996 pure; hexagonal crystalline; specimen 18 mm in dia; polished.
7	358	L	1957	293.2	< 4		0.065 Br; same structure and dimensions as the above specimen; prepared by melting vitreous selenium containing bromine in a ceramic crucible, pouring into a molybdenum beaker, first crystallization at 130 C for 30 min, then second crystallization at 200 C for 25 min, polished.
8	358	L	1957	293.2	< 4		0.13 Br; same structure, dimensions, and fabrication method as above.
9	358	L	1957	293.2	< 4		0.032 Br; same structure, dimensions, and fabrication method as above.
10	359	P	1956	273-323			Pure selenium from Merck; thermal conductivity values calculated from measured data of thermal diffusivity, specific volume, and the specific heat data taken from Tammann, G. and Von Gronow, H. E. (Z. Anorg. Allg. Chemie, 192, 193, 1930).
11	360	L	1917	298.2		Disc-1	Vitreous selenium; 6.5 cm in dia and about 0.5 cm thick; cast in a hot iron mould, aged for 7 yrs.
12	360	L	1917	297-331		Disc-2	Vitreous selenium; 6.5 cm dia x 0.7523 cm thick; cast in a hot iron mould, aged for 1 to 8 days.
13	360	L	1917	298.2		Disc-2	The above specimen re-tested after being aged for 1 yr.
14	360	L	1917	298.2		Disc-3	Vitreous selenium; 6.5 cm dia x ~0.5 cm thick; cast in a hot iron mould, aged for 10 days.
15	360	L	1917	298.2		Disc-3	The above specimen re-tested after being aged for 1 yr.
16	360	L	1917	298.2		Disc-4	Similar to above but prepared from highly purified selenium and aged for 10 days.
17	360	L	1917	298.2		Disc-5	Similar to above but aged for 2 days.
18	360	L	1917	298.2		Disc A-I	Crystalline specimen 6.5 cm dia x ~0.5 cm thick; prepared by heating the vitreous disk in an oil oven to 160 C for 1 hr, cooled slowly, ground and polished; aged for 11 days.
19	360	L	1917	298.2		Disc A-II	The above specimen aged for 164 days.
20	360	L	1917	298.2		Disc A-III	The above specimen aged for 1 yr.
21	360	L	1917	298.2		Disc B-I	Similar to the above specimen but prepared by heating at 170 C and aged for 16 days.
22	360	L	1917	298.2		Disc B-II	The above specimen aged for 134 days.

SPECIFICATION TABLE NO. 50 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
23	360	L	1917	298.2		Disc B-III	The above specimen aged for 1 yr.
24	360	L	1917	298-326		Disc C-I	Crystalline specimen; 6.5 cm dia x 0.5774 cm thick; prepared by heating at 180 C and aged for 38 days.
25	360	L	1917	298-326		Disc C-II	The above specimen re-tested after being aged for 95 days.
26	360	L	1917	298-330		Disc C-III	The above specimen re-tested after being aged for 1 yr.
27	360	L	1917	298-325		Disc D-I	Similar to the above specimen but prepared by heating at 192 C and aged for 28 days.
28	360	L	1917	298.2		Disc D-II	The above specimen re-tested after being aged for 148 days.
29	360	L	1917	298.2		Disc D-III	The above specimen re-tested after being aged for 1 yr.
30	360	L	1917	298.2		Disc E-I	Similar to the above specimen but prepared by heating at 200 C and aged for 9 days.
31	360	L	1917	298.2		Disc E-II	The above specimen re-tested after 156 days.
32	360	L	1917	298.2		Disc E-III	The above specimen re-tested after 1 yr.
33	360	L	1917	298.2		Disc F-I	Similar to the above specimen but prepared by heating at 214 C and aged for 42 days.
34	360	L	1917	298.2		Disc F-III	The above specimen re-tested after being aged for 1 yr.
35	361	L	1957	294		1	99.994 pure; amorphous; 20 mm dia cylindrical specimen.
36	361	L	1957	294		1	0.0035 Cl; amorphous; 20 mm dia cylindrical specimen.
37	361	L	1957	294		1	Similar to the above specimen but doped with 0.015 Cl.
38	361	L	1957	294		1	Similar to the above specimen but doped with 0.03 Cl.
39	361	L	1957	294		1	Similar to the above specimen but doped with 0.06 Cl.
40	361	L	1957	294		1	Similar to the above specimen but doped with 0.125 Cl.
41	361	L	1957	294		2	99.994 pure; crystalline; 20 mm dia cylindrical specimen; prepared from vitreous form by heating at 130 C for 40 min.
42	361	L	1957	294		2	Similar to above but doped with 0.015 Cl.
43	361	L	1957	294		2	Similar to above specimen but doped with 0.03 Cl.
44	361	L	1957	294		2	Similar to above specimen but doped with 0.06 Cl.
45	361	L	1957	294		2	Similar to above specimen but doped with 0.125 Cl.
46	361	L	1957	294		3	99.994 pure; crystalline; 20 mm dia cylindrical specimen; prepared from vitreous selenium by heating at 200 C for 40 min.
47	361	L	1957	294		3	Similar to above specimen but doped with 0.015 C.
48	361	L	1957	294		3	Similar to above specimen but doped with 0.03 C.
49	361	L	1957	294		3	Similar to above specimen but doped with 0.06 C.
50	361	L	1957	294		3	Similar to above specimen but doped with 0.125 C.

SPECIFICATION TABLE NO. 50 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
51	362	L	1957	291.7		1	99.996 pure; amorphous.
52	362	L	1957	291.7		2	Amorphous selenium doped with 0.0035 Cl.
53	362	L	1957	291.7		3	Similar to the above specimen but doped with 0.007 Cl.
54	362	L	1957	291.7		4	Similar to the above specimen but doped with 0.015 Cl.
55	362	L	1957	291.7		5	Similar to the above specimen but doped with 0.03 Cl.
56	362	L	1957	291.7		6	Similar to the above specimen but doped with 0.06 Cl.
57	362	L	1957	291.7		7	Similar to the above specimen but doped with 0.125 Cl.
58	363	L	1958	303-353		1	99.996 pure; crystalline.
59	363	L	1958	303-353		2	Crystalline selenium doped with 0.0035 Cl.
60	363	L	1958	303-353		3	Crystalline selenium doped with 0.007 Cl.
61	363	L	1958	303-353		4	Crystalline selenium doped with 0.015 Cl.
62	363	L	1958	303-353		5	Crystalline selenium doped with 0.06 Cl.
63	363	L	1958	303-353		6	Crystalline selenium doped with 0.03 Cl.
64	364	L	1957	299.2			99.994 pure; amorphous.
65	364	L	1957	299.2			99.994 pure; crystalline specimen formed by heating vitreous selenium at 214 C.
66	364	L	1957	299.2			0.069 I; amorphous specimen.
67	364	L	1957	299.2			0.069 I; crystalline specimen.
68	364	L	1957	299.2			0.103 I; amorphous specimen.
69	364	L	1957	299.2			0.103 I; crystalline specimen.
70	365	L	1958	1.9-95		Se 1	Glassy specimen ~3 cm long and 1 cm dia; prepared by melting selenium powder (of probable 99.9+ purity) in a split brass mold at about 250 C and quenching rapidly in ice water.
71	365	L	1958	2.2-130		Se 2	Polycrystalline; same dimensions and preparation method as above.
72	365	L	1958	4.3-90		Se 3	Crystalline; 6 cm long, 1 cm in dia; supplied by Fairmount Chemical Co. (Newark, N.J.).
73	365	L	1958	2.7-92		Se 4	Polycrystalline specimen ~4 cm long and 4 mm in dia; average grain dimensions ~20 μ; produced by melting 99.999 pure selenium powder (from Canadian Copper Refiners Ltd) under vacuum in a glass tube, chilling rapidly to produce solid rod of glassy selenium, and annealing in vacuo at about 210 C for 50-60 hrs.
74	365	L	1958	2.8-77		Se 5	Similar to the above specimen but having a regular triangular cross section of about 0.26 cm^2.

SPECIFICATION TABLE NO. 50 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
75	522	L	1961	293-363			99.996 pure; polycrystalline; specimen about 10 mm thick and 16 mm in dia; annealed at 110 C and 210 C for 1 hr.
76	522	L	1961	293-363			0.05 Tl; polycrystalline selenium specimen of similar dimensions as above; prepared by melting together 99.996 pure selenium and Tl_2Se in a vacuum of 10^{-4} mm Hg; annealed at 110 C and 210 C for 1 hr.
77	522	L	1961	293-363			Similar to the above specimen but doped with 0.0125 Tl.
78	522	L	1961	293-363			Similar to the above specimen but doped with 0.1 Tl.
79	791	L	1963	293-373		1	99.996 pure; crystalline; ~10 mm dia cylindrical specimen; heated at 215 C for 8 hrs.
80	791	L	1963	293-373		2	Similar to the above specimen but doped with 0.01 Bi.
81	791	L	1963	293-373		3	Similar to the above specimen but doped with 0.02 Bi.
82	791	L	1963	293-373		4	Similar to the above specimen but doped with 0.04 Bi.
83	791	L	1963	293-373		5	Similar to the above specimen but doped with 0.06 Bi.
84	791	L	1963	293-373		6	Similar to the above specimen but doped with 0.08 Bi.
85	791	L	1963	293-373		7	Similar to the above specimen but doped with 0.1 Bi.
86	792, 1012	L	1963	90-300	3-5	V-3	Amorphous; about 10 mm in dia; prepared from the melt of 99.999 pure selenium by rapid cooling in vacuum.
87	792, 1012	L	1963	87-300	3-5	V-4	Similar to above but prepared from 99.9999 pure selenium.
88	792, 1012	L	1963	87-300	3-5	V-5	Similar to above but prepared from 99.99999 pure selenium.
89	792, 1012	L	1963	85-453	3-5	V-3	Crystalline; about 10 mm in dia; prepared from the amorphous specimen V-3 by annealing in vacuum at 210 C for 50 hrs.
90	792, 1012	L	1963	90-453	3-5	V-4	Similar to above but prepared from the amorphous specimen V-4.
91	792, 1012	L	1963	85-455	3-5	V-5	Similar to above but prepared from the amorphous specimen V-5.
92	793, 934	P	1964	293-573	±10		Data cover both solid and liquid state.
93	805	L	1966	294-313	3	1	Amorphous selenium, glass-formation temp ~31 C.
94	805	L	1966	294-313	3	3	Amorphous selenium irradiated by an electron beam with an energy of 5 MeV for 30 min.
95	805	L	1966	294-313	3	2	Similar to above but irradiated for only 10 min.
96	805	L	1966	288-318	3	1	Amorphous selenium.
97	805	L	1966	288-318	3	3	0.197 P; amorphous.
98	806	L	1966	87-455			Hexagonal single crystal grown out of a melt of grade B5 selenium (99.99999 pure), each crystal being 15 x 2 x 2 mm in size; specimen dimensions 7 x 6 x 4 mm; measurement carried out in darkness under a vacuum of 10^{-4} mm Hg; heat flow parallel to crystal axis.

SPECIFICATION TABLE NO. 50 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
99	806	L	1966	93-465			Similar to above but measured perpendicular to crystal axis.
100	898	L	1966	293-315	3-5	B-5	99.99999 pure; prepared from the melt by rapid cooling in vacuum; vitrification temp 31 C.
101	898	L	1966	293-315	3-5		Doped with 0.05 Cd; prepared from the melt by rapid cooling in vacuum; vitrification temp 32.5 C.
102	898	L	1966	89-341	3-5	B-4	99.9999 pure; amorphous; prepared from the melt by rapid cooling in vacuum.
103	898	L	1966	86-338	3-5	B-4	Similar to the above specimen except annealed at 373 K for 0.5 hr.
104	898	L	1966	88-335	3-5	B-4	Similar to the above specimen except annealed at 373 K for 2 hrs.
105	898	L	1966	86-338	3-5	B-4	Similar to the above specimen except annealed at 373 K for 10 hrs.
106	898	L	1966	89-533	3-5		Crystalline specimen prepared from the amorphous phase (specimen B-4) by annealing in vacuum at 210 C for 60 hrs; includes the liquid phase.
107	898	L	1966	290-317	3-5		Doped with 0.05 Tl; amorphous specimen, prepared from the melt of 99.99999 pure selenium with admixture of thallium by rapid cooling in vacuum.
108	898	L	1966	291-317	3-5		Similar to the above specimen except doped with 0.125 Tl.
109	961	L	1967	1.8-94		A	Single crystal; specimen 1.46 mm^2 in cross section and 1.21 mm long; grown from the vapor phase; heat flow parallel to the c-axis (additional information and the tabulated data obtained from author).
110	961	L	1967	1.9-112		B	Single crystal; specimen 0.973 mm^2 in cross section and 0.98 mm long; grown from the melt, heat flow parallel to the c-axis (additional information and the tabulated data obtained from author).
111	961	L	1967	2.0-90		C	Cut from the same crystal as the above specimen. In the form of an almost circular platelet 12.1 mm in dia and 1.2 mm thick, with c-axis parallel to the flat faces; measured in the direction perpendicular to both the thickness and the c-axis, in the central portion of the platelet across a length of 2.5 mm with effective cross-section 15 mm^2 (additional information and the tabulated data obtained from author).
112	961	L	1967	1.8-89		D	Cut from the same crystal as the above specimen, in the form of an almost circular platelet 12.1 mm in dia and 1.60 mm thick, with c-axis parallel to the flat faces; measured in the direction perpendicular to both the thickness and the c-axis, in the central portion of the platelet across a length of 3.66 mm with effective cross-section 19.4 mm^2 (additional information and the tabulated data obtained from author).

REMARKS

The recommended values are for high-purity selenium. The recommended values for selenium single crystals that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures above 20 K. Below 20 K the values are intended only for indicating the general trend, since the thermal conductivity near and below the corresponding temperature of its maximum is highly sensitive to small physical and chemical variations of the specimens. The recommended values for amorphous selenium are thought to be accurate to within 10%.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated or estimated.

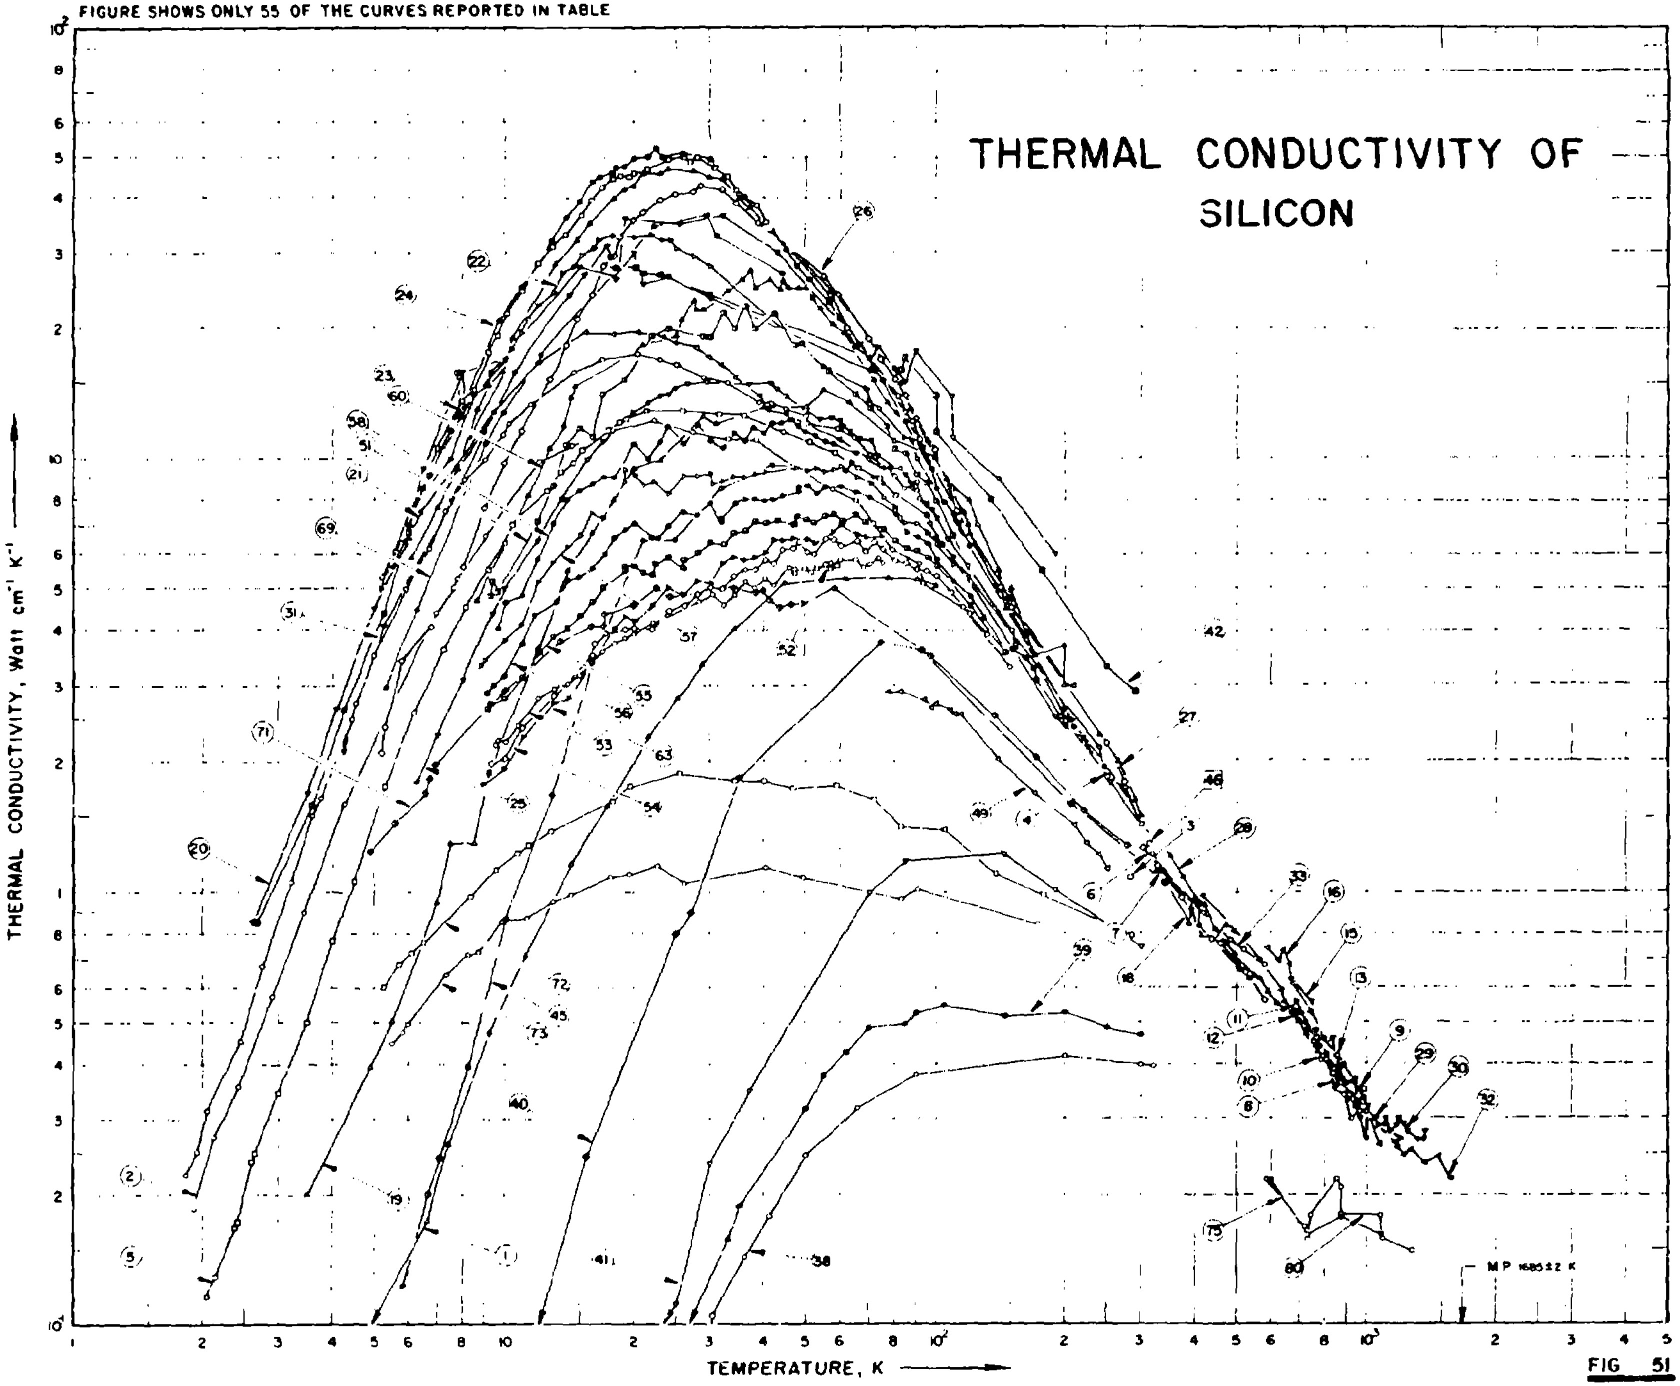

FIG 51

SPECIFICATION TABLE NO. 51 THERMAL CONDUCTIVITY OF SILICON

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 51]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	274	L	1954	1.7-100		Si 1	High purity; polycrystalline, composed of fairly large crystallites about 0.2 mm in size; specimen 1 cm long, 1.5 mm^2 cross section; supplied by Messrs. Johnson Matthey Co.; nickel plated to solder thermal contacts, excess nickel dissolved with acid.
2	343	L	1956	1.9-149	1-5	Si 1	Pure single crystal; n-type; specimen cross sectional area 1.75 x 1.5 mm^2; electrical resistivity 6.7 ohm cm at 295 K.
3	351		1954	283	5-8		Pure crystal.
4	354	L	1957	1.8-300		Si 2	Pure single crystal; n-type; axis of specimen along [100] direction; 5 x 0.215 x 0.198 cm; carrier concentration 5 x 10^{14} cm^{-3}; electrical resistivity 15-25 ohm cm at room temp.
5	354	L	1957	2.1-80		Si 3	Gold-doped single crystal; p-type; axis of specimen [100] direction; 5 x 0.236 x 0.221 cm; carrier concentration 10^{15} cm^{-3}; electrical resistivity 18-26 ohm cm at room temp.
6	578	C	1960	303-579	±5		Pure single crystal; p-type; electrical resistivity 3 ohm cm at room temp; FH stainless steel used as comparative material.
7	578	C	1960	328-533	±5		Pure single crystal; n-type; electrical resistivity 3 ohm cm at room temp. FH stainless steel used as comparative material.
8	692, 745	C	1962	767, 846	±20	KA-1 (Knapic)	p-type single crystal; 23 mm dia x 8 mm thick; specimen axis in (111) orientation; supplied by Knapic Electro-Physics; carrier concentration 10^{18} cm^{-3}. Armco iron used as comparative material.
9	692, 745	C	1962	769-989	±20	KA-1 (Knapic)	Second run of the above specimen.
10	692, 745	C	1962	756-997	±20	KA-1 (Knapic)	Third run of the above specimen.
11	692, 745	C	1962	687, 826	±20	KA-1 (Knapic)	Fourth run of the above specimen.
12	692, 745	C	1962	679, 778	±20	KB-1 (Knapic)	n-type single crystal; 23 mm dia x 8 mm thick; specimen axis in (111) orientation; supplied by Knapic Electro-Physics; carrier concentration 5 x 10^{16} cm^{-3}; Armco iron used as comparative material.
13	692, 745	C	1962	857, 906	±20	KB-2 (Knapic)	Similar to above.
14	692, 745	C	1962	748	±20	KB-2 (Knapic)	Second run of above specimen.
15	692, 745	C	1962	669-1092	±20	KB-2 (Knapic)	Third run of above specimen.

SPECIFICATION TABLE NO. 51 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	678	E	1962	588-1073			p-type single crystal; 0.25 in. dia x 1.5 in. long; corrected for isothermal conditions and shield.
17	678	E	1962	593-883			The above specimen held for some time at 1073 K; measured in the cooling-down period.
18	678	E	1962	334-473			The above specimen measured with the length of the thermocouple wire between junctions and shield increased by a factor of approx two to three.
19	679	L	1961	3.5-210	10	Q-20	p-type single crystal; boron doped (1×10^{15} atoms cm^{-3}); O concentration, 2×10^{17} atoms cm^{-3}; dimensions 3 x 3 x 20 mm; supplied by H. L. Taylor, Texas Instruments, Inc.; electrical resistivity reported as 7.2 ohm cm at 0 C.
20	679	L	1961	2.6-190	10	M-1	p-type single crystal; boron doped (2×10^{12} atoms cm^{-3}); oxygen concentration, 10^{17} cm^{-3}; dimensions 3 x 3 x 20 mm; supplied by F. J. Bourassa, Electronics Chemical Div., Merck and Co., Inc.; electrical resistivity reported as 2000 ohm cm at 0 C.
21	680	L	1961	5.5-246		K4	n-type single crystal; oxygen concentration, 1.4×10^{18} cm^{-3}; specimen cross section 0.625 x 0.627 cm; carrier concentration 3.5×10^{14} cm^{-3}, dislocation density of the order of 10^4 cm^{-2}; electrical resistivity reported as 12 ohm cm at room temp.
22	680	L	1961	5.2-208		K5	n-type single crystal; oxygen concentration, 6×10^{17} cm^{-3}; specimen cross section 0.622 x 0.622 cm; carrier concentration 3.5×10^{13} cm^{-3}; dislocation density of the order of 10^4 cm^{-2}; electrical resistivity reported as 110 ohm cm at room temp.
23	680	L	1961	5.3-200		M6	n-type single crystal; phosphorus doped, oxygen concentration, $< 10^{16}$ cm^{-3}; carrier concentation 1.1×10^{15} cm^{-3}; specimen cross section, 0.634 x 0.640 cm; dislocation density of the order of 10^4 cm^{-2}; electrical resistivity reported as 5 ohm cm at room temp.
24	689	L	1961	6-120		M4	n-type single crystal; phosphorus doped, oxygen concentration $< 10^{16}$ cm^{-3}; carrier concentration 4×10^{13} cm^{-3}; cross section 0.637 x 0.629 cm; dislocation density of the order of 10^4 cm^{-2}; electrical resistivity reported as 260 ohm cm at room temp.
25	680	L	1961	6.3-298		SA-1	p-type single crystal; boron doped; oxygen concentration 7×10^{17} cm^{-3}; cross section 0.616 x 0.623 cm; carrier concentration 4.8×10^{15} cm^{-3}; electrical resistivity reported as 3.0 ohm cm at room temp.
26	680	L	1961	5.2-275		M3	p-type single crystal; boron doped; oxygen concentration $< 10^{16}$ cm^{-3}; cross section 0.635 x 0.632 cm; carrier concentration 4.0×10^{15} cm^{-3}; dislocation density of the order of 10^4 cm^{-2}; electrical resistivity reported as 4.5 ohm cm at room temp.
27	680	L	1961	5.9-300		M2	p-type single crystal; boron doped; oxygen concentration $< 10^{16}$ cm^{-3}; specimen cross section 0.630 x 0.640 cm; carrier concentration 4.0×10^{14} cm^{-3}; dislocation density of the order of 10^4 cm^{-2}; electrical resitivity reported as 45.5 ohm cm at room temp.

SPECIFICATION TABLE NO. 51 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
28	681, 660	P	1963	300-850		4A	p-type single crystal; specimen axis in [111] orientation; 0.9 cm in dia, 6 cm long; electrical resistivity reported as 107 ohm cm at 300 K; thermal conductivity values calculated from measured data of thermal diffusivity using the specific heat data taken from Dennison, D. H. (Institute for Atomic Research, Ames, Iowa) and density (determined by Smakula, A. and Sils, V.) 2.32902 ±3 x 10^{-6} g cm^{-3} at 298 K.
29	681, 660	P	1963	775-1200		1F	n-type single crystal; 0.9 cm in dia, 6 cm long; specimen axis in [111] orientation; electrical resistivity reported as 33.9, 50.0, 58.0, 42.0, 6.2, and 0.1 ohm cm at 300, 400, 460, 500, 650, and 1000 K, respectively; thermal conductivity values calculated by the same method as above.
30	681, 660	P	1963	1115-1370		3C	n-type single crystal; 0.9 cm in dia, 6 cm long; specimen axis in [100] orientation; electrical resistivity reported as 1010, 2000, 1700, 125, 6.2, and 0.1 ohm cm at 300, 375, 400, 500, 650, and 1000 K, respectively; thermal conductivity values calculated by the same method as above.
31	684	L	1964	4.3-304	±5		High purity; p-type single crystal; specimen axis in [111] orientation; 2 cm long and average dia 0.44 cm; vacancy clusters < 1 μ in dia; electrical resistivity reported as ~2000 ohm cm at room temp; measured in helium atmosphere.
32	684	R	1964	418-1577	±5		n-type single crystal; 2.6 cm dia x ~13 cm long; axis of cylinder in [111] direction; produced by floating zone process in argon atmosphere; dislocation density of the order of 10^{5} cm^{-2}; carrier concentration, 1.27 x 10^{13} cm^{-3}; electrical resistivity reported as 440 ohm cm at room temp; measured in helium atmosphere; after the measurement, room temp resistivity dropped to 177 ohm cm, carrier concentration rose to 2.46 x 10^{13} cm^{-3}.
33	747, 746	C	1961	320-578		S-B-1	Single crystal; p-type; impurity concentration 2 x 10^{15} atoms cm^{-3}; supplied by Battelle Memorial Institute; ground to a dia of 11.8 mm and sliced to 7 mm thick; measured in a vacuum of 10^{-6} mm Hg; Armco iron (99.9^{+} Fe) used as comparative material.
34	747, 746	C	1961	300-495		S-B-1	Second run of the above specimen.
35	747, 746	C	1961	404, 307		S-B-1	Third run of the above specimen.
36	747, 746	C	1961	302-467		S-B-2	Similar to above except impurity concentration 6 x 10^{14} atoms cm^{-3}.
37	747, 746	C	1961	336-394		S-B-2	Second run of the above specimen.
38	748	L	1964	10-320	±5	R-3	Polycrystalline, p-type; major impurity boron, 5 x 10^{26} atoms cm^{-3}; 1.24 cm effective dia, 3.2 cm long; electrical conductivity reported as 3.8 x 10^{3} ohm^{-1} cm at 300 K.
39	748	L	1964	2.1-300	±5	R-5	Synthetic single crystal, p-type; major impurity boron, 3 x 10^{20} atoms cm^{-3}; 0.56 cm effective dia, 2.6 cm long; electrical conductivity reported as 2.2 x 10^{3} ohm^{-1} cm^{-1} at 300 K.

SPECIFICATION TABLE NO. 51 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
40	748	L	1964	3.2-340	±5	R-6	Synthetic single crystal, n-type; major impurity phosphorus, 2.0 x 10^{19} atoms cm^{-3}; 1.20 cm effective dia, 3.2 cm long; electrical conductivity reported as 3.6 x 10^{2} ohm^{-1} cm^{-1} at 300 K.
41	748	L	1964	3.8-300	±5	R-55	Synthetic single crystal, n-type; major impurity phosphorus, 1.7 x 10^{20} atoms cm^{-3}; 0.55 cm effective dia, 1.7 cm long; electrical conductivity reported as 1.5 x 10^{3} ohm^{-1} cm^{-1} at 300 K.
42	749	L	1961	2.7-290	3	Si-1	High purity; 0.2 x 0.4 x 2 cm; supplied by Texas Instruments Inc.; electrical resistivity ~~2,000~~ 2000 ohm cm at ~~max thermal conductivity~~ 0C.
43	749	L	1961	3.1-106	3	Si-2	Similar to the above specimen but with more impurities; electrical resistivity 18 ohm cm at ~~max thermal conductivity~~ 0C.
44	749	L	1961	3.6-290	3	Si-3	Similar to the above specimen but with more impurities; electrical resistivity 7.2 ohm cm at ~~max thermal conductivity~~ 0C.
45	749	L	1961	5.8-210	3	Si-4	Similar to the above specimen but with more impurities; electrical resistivity 0.57 ohm cm at max thermal conductivity.
46	566	C	1956	313		Si	p-type; electrical resistivity 2 to 3 ohm cm at 293 K; Firth Brown F.H. steel used as comparative material.
47	750	P	1961	311-1018	2	Si-142	Solid specimen; electrical resistivity 100 ohm cm at ~~max thermal conductivity~~ room temperature; measured in vacuo; thermal conductivity values calculated from measured data of thermal diffusivity using specific heat data taken from Amer. Inst. Physics Handbook (McGraw Hill Book Co., New York, p. 4-42, 1957).
48	751		1963	84-285			Virgin specimen.
49	751		1963	78-250			Similar to the above specimen except irradiated with 1.2 x 10^{18} fast neutrons cm^{-2}.
50	752	P	1962	310-1220		Si-1142	Pure; intrinsic; single crystal; thermal conductivity values calculated from measured data of thermal diffusivity using specific heat data taken from Amer. Inst. Physics Handbook (McGraw Hill Book Co., New York, 1957).
51	899	L	1965	9.3-299		1	Prepared from high-purity vacuum-floating-zone single crystal p-type (residual boron) material obtained from Merck and Co.; 0.152 cm wide x 0.046 cm thick; long dimension in the <111> direction; electrical resistivity 5000 ohm cm, carrier concentration ~3 x 10^{12} cm^{-3}.
52	899	L	1965	47-59		1	The above specimen irradiated in <110> direction with a total time-integrated flux of 8.0 x 10^{18} 2-Mev e cm^{-2} on a length of 1.0 cm; annealed at 60 K for 15 min.
53	899	L	1965	9.5-76		1	The above specimen annealed again for 15 min at 77 K.
54	899	L	1965	9.3-132		1	The above specimen annealed again for 15 min at 135 K.
55	899	L	1965	9.1-146		1	The above specimen annealed again for 15 min at 150 K.
56	899	L	1965	9.1-176		1	The above specimen annealed again for 15 min at 180 K.
57	899	L	1965	8.8-227		1	The above specimen annealed again for 15 min at 230 K.

SPECIFICATION TABLE NO. 51 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
58	899	L	1965	9.7-172		1	The above specimen annealed again for 15 min at 280 K.
59	899	L	1965	9.4-300		1	The above specimen annealed again for 15 min at 410 K.
60	899	L	1965	8.6-303		2	Prepared from high-purity vacuum-floating-zone single crystal p-type (residual boron) material obtained from Merck and Co.; 0.153 cm wide x 0.048 cm thick; long dimension was the <111> direction; electrical resistivity 5000 ohm cm; carrier concentration ~3 x 10^{12} cm^{-3}.
61	899	L	1965	47-59		2	The above specimen irradiated in <110> direction with a total time-integrated flux of 8.0 x 10^{18} 2-Mev e cm^{-2} on a length of 1.0 cm; annealed at 60 K for 15 min.
62	899	L	1965	8.9-76		2	The above specimen annealed again for 15 min at 77 K.
63	899	L	1965	8.9-132		2	The above specimen annealed again for 15 min at 135 K.
64	899	L	1965	8.8-146		2	The above specimen annealed again for 15 min at 150 K.
65	899	L	1965	8.7-176		2	The above specimen annealed again for 15 min at 180 K.
66	899	L	1965	8.4-226		2	The above specimen annealed again for 15 min at 230 K.
67	899	L	1965	8.5-81		2	The above specimen annealed again for 15 min at 280 K.
68	899	L	1965	8.9-301		2	The above specimen annealed again for 15 min at 410 K.
69	339, 883	L	1965	5.4-285	10 in 4-20K and 100-300K; 15 in 20-100K		Phosphorus-doped n-type single crystal; 15 x 4 x 2 mm; long dimension in the <111> direction; obtained by floating zone technique; electrical resistivity 0.35 ohm cm.
70	339, 883, 988	L	1965	5.5-288	Same as above		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux 1.1 x 10^{15} n cm^{-2}.
71	339, 883	L	1965	4.9-277	Same as above		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux 2.5 x 10^{15} n cm^{-2}.
72	883	L	1965	5.5-173	Same as above		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux 1.7 x 10^{18} n cm^{-2}.
73	883	L	1965	5.2-286	Same as above		Similar to the above specimen; irradiated at 30 C with a fast-neutron integrated flux 3.4 x 10^{20} n cm^{-2}.
74	335	C	1965	567-1072		S-1	n-type single crystal; carrier concentration N_D = 5 x 10^{15} cm^{-3}; high purity silicon used as comparative material.
75	335	C	1965	596-1073		S-2	n-type single crystal; N_D 5 x 10^{15} cm^{-3}; Armco iron used as comparative material.
76	335	C	1965	98			n-type single crystal; supplied by Knapic Electro-Physics; 23 mm dia x 8 mm thick; circular cross-section perpendicular to <111> direction; N_D ~5 x 10^{15} cm^{-3}; Armco iron used as comparative material.
77	335	C	1965	179-256			2nd run of the above specimen.
78	335	C	1965	143, 217			3rd run of the above specimen.

SPECIFICATION TABLE NO. 51 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
79	901	C	1965	98-255	10		n-type single crystal; supplied by Knapic Electro-Physics; 23 mm dia x 8 mm thick; circular cross-section perpendicular to <111> direction; $N_D \sim 5 \times 10^{15}$ cm^{-3}; Armco iron used as comparative material.
80	902	C	1967	588-1276	20-25	Si-E4	0.1 P-doped; n-type single crystal; measured in a vacuum of 5×10^{-6} to 10^{-6} torr; Armco iron used as comparative material.

REMARKS

The recommended values are for high-purity silicon. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 4% of the true values at room and moderate temperatures and 4 to 10% at other temperatures above 50 K. The thermal conductivity near and below the corresponding temperature of its maximum is highly sensitive to small physical and chemical variations of the specimens, and the values below 50 K are intended as typical values for indicating the general trend.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$m T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

‡ Values in parentheses are extrapolated.

[For Data Reported in Figure and Table No. 52]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	51	L	1956	14-21		Ag 2	Commercially pure; supplied by Nordiska Affiveriet, Halsingborg; cold-worked; electrical resistivity ratio $\rho(273K)/\rho_0 = 38.4$.
2	51	L	1956	15-21		Ag 2t	The above specimen etched and annealed at 740 K; electrical resistivity reported as 0.00447, 0.00519, 0.00619, 0.00743, 0.238, 0.297, 0.359, and 1.47 μohm cm at 14, 16, 18, 20, 70, 80, 90, and 273 K, respectively; electrical resistivity ratio $\rho(273K)/\rho_0 = 417$.
3	51	L	1956	16-90		Ag 4t	Similar to the above specimen but annealed at 750 K; electrical resistivity reported as 0.00694, 0.00758, 0.00852, 0.00983, 0.235, 0.299, 0.363, and 1.48 μohm cm at 14, 16, 18, 20, 70, 80, 90, and 273 K, respectively; electrical resistivity ratio $\rho(273K)/\rho_0 = 250$.
4	77	E	1900	291, 373			99.98 pure; 1.1086 cm dia x 25.2 cm long; density 10.53 g cm^{-3} at 18 C; electrical conductivity reported as 61.4 and 46.9 x 10^4 ohm^{-1} cm^{-1} at 18 and 100 C, respectively.
5	6	L	1931	437-838			99.9 pure; 0.585 cm dia x 7-8 cm long; melting point 961 C.
6	58	L	1934	21-91		Ag 1	Pure; cold-worked and annealed at 350 C for 2 hrs.
7	97, 122	L	1952	2.3-38	2-3	JM 1722; Ag 1	99.99 pure; polycrystalline wire; 1.22 mm dia x 2.85 cm long; supplied by Johnson Matthey; $\rho(273K)/\rho(20K) = 30.9$.
8	78	E	1931	283-291	2	Ag 1	Commercially pure electrolytic silver; 0.05286 cm dia x 8.82 cm long; electrical conductivity 64.6 x 10^4 ohm^{-1} cm^{-1} at 273 K; Lorenz function 2.32 x 10^{-8} V^2 K^{-2} at 273 K.
9	78	E	1931	278-284	2	Ag II	Spectroscopically pure; 0.05059 cm dia x 8.74 cm long; electrical conductivity 61.2 x 10^4 ohm^{-1} cm^{-1} at 273 K; Lorenz function 2.41 x 10^{-8} V^2 K^{-2} at 273 K.
10	88	L	1908	110-306			99.9 pure; 0.585 cm dia x 7-8 cm long; density 10.47 g cm^{-3} at 21 C; electrical resistivity reported as 0.460, 0.470, 0.456, 0.609, 0.660, 0.693, 0.880, 0.923, 0.942, 1.236, 1.239, 1.245, 1.468, 1.471, 1.675, and 1.684 μohm cm at -178.3, -177.7, -176.1, -151.2, -144.9, -139.2, -109.0, -102.5, -98.6, -54.9, -52.8, -50.6, -13.0, -12.0, -21.0, and 21.8 C, respectively.
11	122	L	1955	1.5-44	3	JM 3351; Ag 2	99.99+ pure; polycrystalline; 1.33 mm dia x 2.8 cm long; supplied by Johnson Matthey; prepared from a 5 mm rod by rolling and drawing; annealed in vacuo at 750 C for several hrs.
12	79	E	1933	90-373			Traces of Bi, Cd, Cu, Pb, Mg, Si, and Na; 0.06095 cm dia x 9.770 cm long; drawn from a rod of H.S. brand silver supplied by A. Hilger, Ltd.; annealed at 500 C; electrical resistivity reported as 0.341, 1.035, 1.510, 2.123, and 2.863 μohm cm at -183.00, -78.50, 0, 100, and 217.96 C, respectively; measured in a vacuum of 10^{-4} mm Hg.
13	147	L	1953	2.0-140	1-3	JM 4606; Ag 1	99.999+ pure; polycrystalline; 2 mm dia rod supplied by Johnson Matthey.
14	147	L	1953	3.3-131	1-3	JM 4606; Ag 2	The above specimen annealed at 650 C; grain size ~0.1 mm.

SPECIFICATION TABLE NO. 52 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
15	147	L	1953	1.7-134	1-3	JM 4606; Ag 3	1.16 mm dia rod drawn from the above specimen.
16	147	L	1953	3.0-135	1-3	JM 4606; Ag 4	The above specimen annealed at 650 C.
17	147	L	1953	2.4-95	1-3	JM 4606; Ag 5	The above specimen, Ag 4, after being removed and replaced in cryostat.
18	342	L	1953	2.3		Ag 1	99.99 pure; polycrystal; annealed; measured in a transverse field of 4.2 kilooersteds.
19	342	L	1953	2.2		Ag 2	99.999 pure; polycrystal; annealed; measured in a tranverse field of 1.09 kilooersteds.
20	342	L	1953	2.2		Ag 2	The above specimen measured in a transverse field of 1.75 kilooersteds.
21	342	L	1953	3.2		Ag 2	The above specimen measured in a transverse field of 1.97 kilooersteds.
22	342	L	1953	2.2		Ag 2	The above specimen measured in a transverse field of 2.7 kilooersteds.
23	342	L	1953	3.2		Ag 2	The above specimen measured in a transverse field of 3.6 kilooersteds.
24	342	L	1953	2.2		Ag 2	The above specimen measured in a longitudinal field of 3.6 kilooersteds.
25	342	L	1953	2.2		Ag 2	The above specimen measured in a transverse field of 3.7 kilooersteds.
26	246	T	1919	273, 373			1 mm dia wire; rolled and drawn; heated 0.5 hr at temp close to melting point; electrical conductivity reported as 57.0 and 41.3 x 10^4 ohm^{-1} cm^{-1} at 0 and 100 C, respectively.
27	436	L	1938	21.18		Ag 37	Single crystal.
28	436	L	1938	21.24		Ag 37	The above specimen measured at H (the transverse magnetic field strength) = 8810 oersteds and at θ (the angle of rotation of the magnetic field in a plane perpendicular to the specimen axis) = + 1° at which the dependence of k on H is maximum.
29	436	L	1938	21.26		Ag 37	The preceding specimen measured at H = 10850 oersteds and at θ = + 1°.
30	436	L	1938	21.18		Ag 37	The above specimen measured without magnetic field.
31	436	L	1938	21.20		Ag 37	The above specimen measured at H = 4580 oersteds and at θ = + 45° at which the dependence of k on H is minimum.
32	436	L	1938	21.26		Ag 37	The above specimen measured at H = 8810 oersteds and at θ = + 45°.
33	436	L	1938	21.27		Ag 37	The above specimen measured at H = 10850 oersteds and at θ = + 45°.
34	58	L	1934	79, 91		Ag e_4	Pure; single crystal; deformed; electrical resistivity 1.50 μohm cm at 0 C.
35	58	L	1934	80		Ag e_4	The above specimen annealed for 2 hrs at 350 C; electrical resistivity 1.49 μohm cm at 0 C.
36	58	•	1934	80, 91		Ag e_5	Pure; single crystal.
37	504	P	1961	295.2	±5		Pure; 1.9 x 1.9 x 0.322 cm; thermal conductivity value calculated from measured datum of thermal diffusivity using specific heat and density values taken from Smithsonian Physical Tables (9th ed., 1954).

SPECIFICATION TABLE NO. 52 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
38	51	L	1956	14-94		Ag-Mn 3	0.14 at. % Mn; polycrystal; rectangular rod specimen of square cross section 2.5 x 2.5 mm; annealed at 720 K for several hrs in vacuo; electrical resistivity reported as 0.233, 0.234, 0.235, 0.237, 0.473, 0.534, 0.595, and 1.69 μohm cm at 14, 16, 18, 20, 70, 80, 90, and 273 K, respectively; electrical resistivity ratio $\rho(273K)/\rho_0$ = 7.26.
39	51	L	1956	15-94		Ag-Mn 2	0.32 at. % Mn; polycrystal; rectangular rod specimen of square cross section 2.5 x 2.5 mm; annealed at 720 K for several hrs in vacuo; electrical resistivity reported as 0.523, 0.521, 0.523, 0.526, 0.772, 0.830, 0.881, and 1.98 μohm cm at 14, 16, 18, 20, 70, 80, 90, and 273 K, respectively; electrical resistivity ratio $\rho(273K)/\rho_0$ = 3.77.
40	22	L	1959	1.6-74			0.14 at. % Mn; polycrystal; prepared from pure silver and from manganese of 99.995+ pure; melted, rolled, and cut into rods of cross sectional area ~2.5 mm^2; residual electrical resistivity 0.27 μohm cm.
41	22	L	1959	1.5-76			0.32 at. % Mn; polycrystal with fine grains; same fabrication method as above; residual electrical resistivity 0.54 μohm cm.
42	649	L	1956	1.5-4.1			0.14 at. % Mn; measured in a magnetic field of 25.5 kilooersteds.
43	649	L	1956	1.9-4.1			0.14 at. % Mn; measured in a magnetic field of 19 kilooersteds.
44	649	L	1956	1.4-4.0			0.14 at. % Mn; measured in a magnetic field of 12 kilooersteds.
45	649	L	1956	3.0-4.0			0.32 at. % Mn; measured in a magnetic field of 19 kilooersteds.
46	649	L	1956	1.5-4.0			0.32 at. % Mn; measured in a magnetic field of 25.5 kilooersteds.
47	230	L	1925	333			99.9 pure; electrical conductivity 58.8 x 10^4 ohm^{-1} cm^{-1} at 25 C.
48	241	E	1911	298			Impurities < 0.3; electrical conductivity 57.35 x 10^4 ohm^{-1} cm^{-1} at 25 C.
49	617	E	1957	338-917			99.99 pure; polycrystal; electrical resistivity reported as 1.89, 2.21, 2.97, 4.62, and 5.91 μohm cm at 338.2, 385.2, 503.2, 753.2, and 917.2 K, respectively; Lorenz function reported as 2.45, 2.46, 2.45, 2.42, and 2.44 x 10^{-8} V^2 K^{-2} at the above temps, respectively.
50	650	E	1960	306			99.99 pure.
51	736	L	1965	0.43-0.93			Pure silver wire.
52	382	L	1966	1.9-22	2.0	69 grade	0.005 at. % Mn; prepared from 99.9999 pure silver supplied by Cominco and 99.95 pure manganese supplied by Johnson Matthey and Mallory; melted in argon; chill cast, rolled to 1 mm thick, rectangular wire cut from the ingot; annealed at 750 C for 4 hrs in a vacuum of < 2 x 10^{-4} torr.
53	382	L	1966	1.8-82	2.0	59 grade	0.067 at. % Mn; same sources of materials and fabrication method as above.
54	382	L	1966	2.0-85	2.0	59 grade	0.11 at. % Mn; same sources of materials and fabrication method as above.
55	382	L	1966	1.8-86	2.0	59 grade	0.31 at. % Mn; same sources of materials and fabrication method as above.

SPECIFICATION TABLE NO. 52 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
56	570	L	1963	2.2-30	1.5	1	Pure; specimen 3 mm in dia and about 6 cm long; supplied by Engelhard Industries in Toronto; rolled and drawn, etched with nitric acid; annealed at 850 C in vacuo for 3 hrs; residual electrical resistivity 799 μμ ohm cm.
57	570	L	1963	2.2-17	1.5	2	Similar to the above specimen except residual electrical resistivity 670 μμ ohm cm.
58	903	L	1966	3.4-29		HPM735; 1	99.9999 Ag, 0.00001 Fe, 0.00001 Si, < 0.00001 Ca, and < 0.00001 Mg; fine grain polycrystalline; obtained from the Consolidated Mining and Smelting Co.; remelted and outgassed, annealed at 550 C for 24 hrs; residual electrical resistivity 0.00081 μohm cm.
59	903	L	1966	5.3-14		HPM735; 2	Similar to the above specimen except annealed at 530 C for 24 hrs and residual electrical resistivity 0.00088 μohm cm.
60	904	C	1962	298.2			0.05 In, cast; copper used as comparative material.
61	1063	E	1927	273.2			99.9 pure; 0.125 in. dia x 10 cm long; obtained from Baker and Co.; electrical resistivity 1.491 μohm cm at 0 C.
62	79	E	1933	90-373			Traces of Bi, Cd, Cu, Pb, Mg, Si, and Na; 0.06095 cm dia x 9.770 cm long; drawn from a rod of H.S. brand silver supplied by A. Hilger Ltd.; electrical resistivity reported as 0.377, 1.036, 1.509, and 2.121 μohm cm at -183.00, -78.50, 0, and 100 C, respectively; measured in a vacuum of 10^{-4} mm Hg.

DATA TABLE NO. 52 THERMAL CONDUCTIVITY OF SILVER

(Impurity < 0.20% each; total impurities < 0.50%)

[Temperature, T, K; Thermal Conductivity, k, Watts $cm^{-1} K^{-1}$]

REMARKS

The recommended values are for well-annealed 99.999⁺% pure silver with residual electrical resistivity ρ_0 = 0.000620 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.20, a = 0.55, m = 2.75, α' = 7.30 x 10^{-4}, and β = 0.0254. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 2% of the true values near room temperature, and 2 to 5% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or estimated.

THERMAL CONDUCTIVITY OF SODIUM

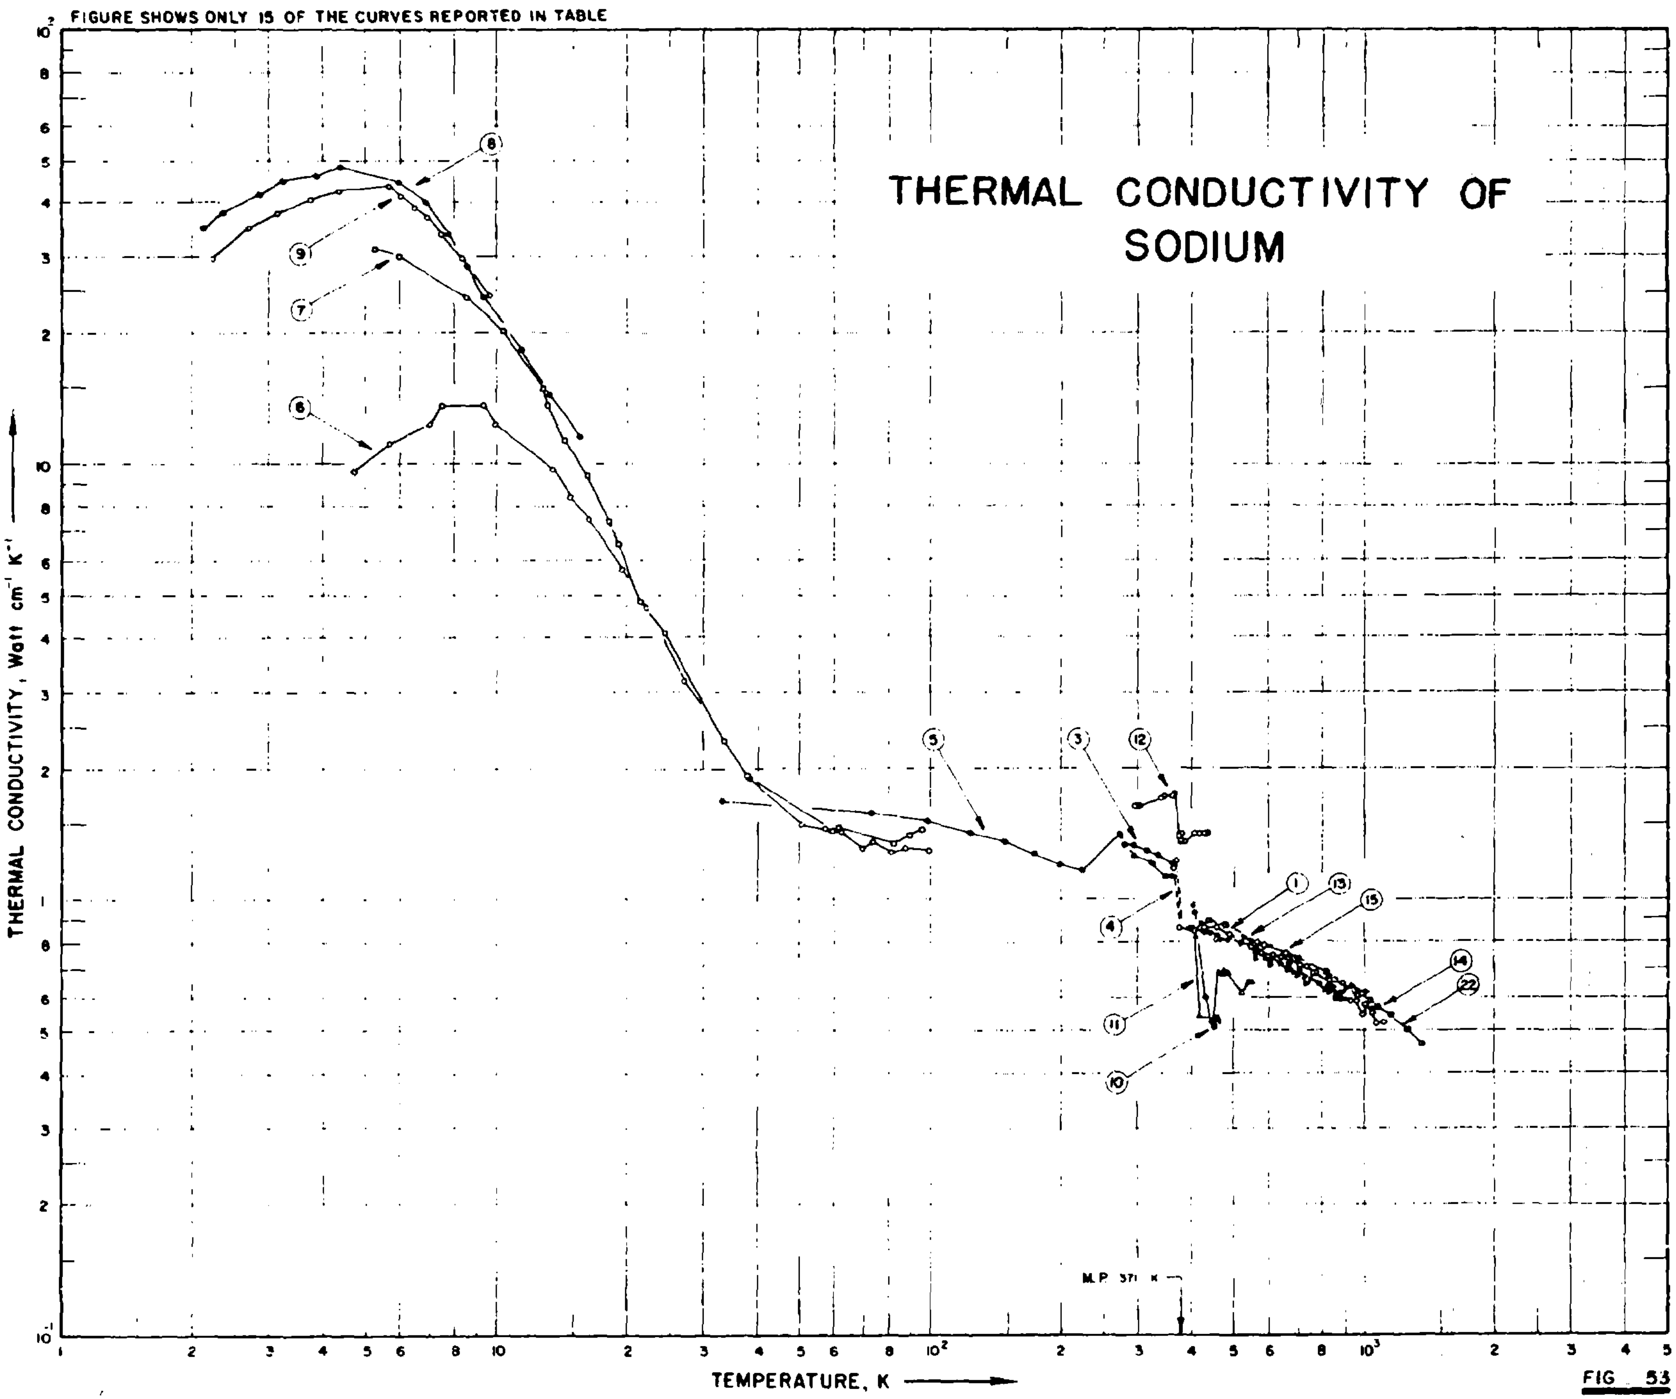

FIG. 53

SPECIFICATION TABLE NO. 53 THERMAL CONDUCTIVITY OF SODIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 53]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	105	P	1956	374-961			Pure; thermal conductivity values calculated from measured (in argon) thermal diffusivity data using specific heat data of Ginnings, D.C., et al (J. Res., NBS, 45, 1950) and density data of Miller, R.R. (Liquid Metals Handbook, 2nd ed, 1952).
2	502, 38	L	1951	455-786	1		Impurities: 0.0001 to 0.001 Ag, < 0.00001 K, < 0.001 O, and negligible amounts of Li, Si, Be, Cs, Rb, Ca, Al, Mg, Fe, Cr, Ni, Sn, and Pb; distilled.
3	72	E	1913	279-361			Pure, supplied by Eimer and Amend; electrical resistivity reported as 4.66, 5.06, 5.63, 6.04, and 6.63 μ ohm cm at 5.7, 21.5, 42.1, 61.4, and 88.1 C, respectively.
4	65	L	1938	358-485			Pure; measured across melting point (97.5 C); electrical conductivity 1.02 and 0.73 x 10^5 ohm^{-1} cm^{-1} at 100 and 200 C, respectively; extrapolation of the thermal conductivity data for the solid and the liquid state to the melting point gives the ratio 1.33.
5	12	F	1926	33-348			Pure; 1.10 cm in dia, 25 cm long; extruded; electrical resistivity 4.26 μ ohm cm at 0 C.
6	10	L	1951	4.7-99	2-3	Na I	Approx 0.01 to 0.1 Ca and Al; supplied by British-Thomson-Houston Research Lab.; cast under vacuum in soft glass tubes; electrical conductivity ranging from 106 to 3.15 x 10^6 ohm^{-1} cm^{-1} at 2 to 46.7 K.
7	10	L	1951	5.3-96	2-3	Na II	Trace of Ag; supplied by Messrs. Philips Ltd, Mitcham; cast under vacuum in soft glass tubes; electrical conductivity ranging from 756 to 1.0 x 10^6 ohm^{-1} cm^{-1} at 2 to 90 K.
8	92	L	1956	2.1-16		Na 2	High purity; 0.5 mm in dia; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 3420 (using Hackspill's value ρ(295 K) = 4.75 μohm cm).
9	92	L	1956	2.2-9.6		Na 3	High purity; 0.13 mm in dia; electrical resistivity ratio ρ(295 K)/ρ(0 K) = 2860 (using Hackspill's value ρ(295 K) = 4.75 μohm cm).
10	243	L	1950	407-462			Commercial grade (high purity); supplied by Mine Safety Appliance Co.; 0.684 in. dia; M.P. 97.9 C; specimen in liquid state; apparatus in open air.
11	243	L	1950	403-549			The above specimen; apparatus in heated oven.
12	385	L	1940	296-433	2		Distilled; measured across melting point (approx. 97 C).
13	592	L	1959	402-1011			M.P. 97.5 C; specimen in liquid state; measured in vacuum of approx. 4 x 10^{-4} mm Hg.
14	866, 769	P	1961	623-1153	±2.5		Impurities (after test): 0.049 Cr, 0.041 K, 0.016 Fe, 0.016 O, 0.014 Ni, < 0.002 Pb, 0.0017 Mn, 0.0011 Ti, < 0.001 Al, 0.00045 Cu, 0.0003 Ca, 0.00027 Mg, and 0.0002 Ag; distilled; 8.4 mm dia, approx. 230 mm long; in liquid state; measured in vacuum; data calculated from an empirical equation derived from experimental data.
15	770, 853	C	1965	363-1103	5.5		Melting point 97.81 C; specimen in liquid state; AISI 304 stainless steel used as comparative material.
16	148, 857		1966	900-1500	±20		Vapor; measured in the 1 mm gap between concentric cylinders 900 mm long; vapor pressure = 0.01 kg cm^{-2}.

SPECIFICATION TABLE NO. 53 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
17	148, 857		1966	1000-1500	± 20		Similar to the above except vapor pressure = 0.05 kg cm^{-2}.
18	148, 857		1966	1000-1500	± 20		Similar to the above except vapor pressure = 0.1 kg cm^{-2}.
19	148, 857		1966	1100-1500	± 20		Similar to the above except vapor pressure = 0.5 kg cm^{-2}.
20	148, 857		1966	1200-1500	± 20		Similar to the above except vapor pressure = 1.0 kg cm^{-2}.
21	148, 857		1966	800-1200	± 20		Similar to the above except measured on saturation curve.
22	861, 859, 860		1964	437-1366			Density reported as 0.8977, 0.8255, 0.8119, 0.7881, 0.7640, 0.7381, and 0.6967 g cm^{-3} at 483.8, 804.1, 873.1, 972.7, 1085, 1189, and 1384 K, respectively; electrical resistivity reported as 5.23, 5.72, 6.54, 6.70, 6.82, 11.04, 11.10, 11.99, 12.42, 14.54, 15.61, 16.25, 18.01, 20.09, 21.86, 24.76, 28.01, 31.54, 35.31, 37.35, 41.76, 46.44, 48.94, 54.16, 60.10, 66.17, 69.59, and 72.48 μ ohm cm at 302, 324, 356, 365, 370, 406, 413, 431, 444, 501, 525, 542, 554, 630, 668, 726, 790, 850, 913, 945, 1009, 1079, 1108, 1171, 1238, 1300, 1334, and 1360 K, respectively; thermal conductivity values calculated from measured electrical resistivity data and the Lorenz number 2.45 x 10^{-8} V^2K^{-2}.
23	756, 862		1962	473-1173			Composition (pretest): < 0.0375 Cs, < 0.0375 K, < 0.0150 Li, 0.0066 Fe, 0.0048 N, 0.0032 O, 0.0022 Ni, and < 0.0010 Cr; composition (posttest): < 0.0375 Cs, < 0.0375 K, 0.0215 C, < 0.0150 Li, 0.0055 O, 0.0049 N, 0.0045 Fe, < 0.0010 Cr, and < 0.0009 Ni; purchased from U.S. Industrial Chemicals Co.; purified by melting and forcing the molten liquid through a 20 micron stainless steel filter under purified argon; electrical resistivity reported as 9.64, 11.44, 13.78, 17.98, 23.16, 28.68, 34.91, 41.86, 46.40, and 51.60 μ ohm cm at 371.2, 424.5, 482.5, 585.7, 693.9, 804.4, 908.7, 1012.8, 1072.8, and 1126.0 K, respectively; thermal conductivity values calculated from electrical resistivity data using Lorenz function of 2.31, 2.31, 2.33, 2.33, 2.36, 2.41, 2.48, and 2.52 x 10^{-8} V^2K^{-2} at 473, 573, 673, 773, 873, 973, 1073, and 1123 K, respectively, the first four values being derived from the thermal conductivity measurements of Ewing, C.T. and Grand, J.A. (NRL Rept. 3835, 1951) and the authors' own electrical resistivity data.
24	868, 867	L	1965	328	< 15		0.13 Na_2O.

REMARKS

The recommended values are for high-purity sodium with residual electrical resistivity ρ_0 = 0.00147 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 100 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.00, α' = 3.50 x 10^{-4}, and β = 0.0600. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

---

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or estimated.

SPECIFICATION TABLE NO. 54 THERMAL CONDUCTIVITY OF TANTALUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 54]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	42	L	1956	842-1820	5		Impurities (pre-test): 0.052 N, traces of Ca, Cu, and Mg; impurities (after test): 0.12 O, 0.044 N, 0.0061 H, traces of Al, Ca, Cu, Fe, and Mg; sintered; density 16.48 g cm^{-3}.
2	8	F	1914	290, 373			Pure; 0.0475 cm dia x 28.14 cm long; specific gravity 16.67; electrical resistivity reported as 14.452 and 19.178 μohm cm at 0 and 100 C, respectively.
3	153	E	1914	1700-2100			Pure; filament.
4	849		1966	1665-2671		No. 5	0.0036 O, 0.0018 N, 0.00009 H, and 0.00005 C; 1.9062 cm dia x 0.2273 cm thick; machined from a 1 in. rod supplied by Fansteel Metallurgical Corp; average grain size 1.86 mm; density 16.60 g cm^{-3}; thermal conductivity derived from the temp distribution on the flat surface of the cylindrical disc heated in vacuum by induction.
5	74	L	1950	1.7-4.2	3	Hilger 8017, Ta1	99.9 pure; polycrystalline; superconducting transition point 4.38 K; measured in a magnetic field; in normal state.
6	74	L	1950	1.7-3.9	3	Hilger 8017, Ta1	The above specimen in superconducting state.
7	122	L	1955	2.0-92	3	JM3804; Ta1	99.98 pure; polycrystalline; specimen 0.225 cm in dia, 3 cm long; Johnson Matthey's unannealed rod; electrical resistivity ratio $\rho(293K)/\rho(20K) = 19.7$; electrical resistivity reported as 0.62, 0.63, 0.67, 0.90, 1.05, 1.46, 2.07, 2.35, 3.04, and 3.51 μohm cm at 11.3, 16.1, 20.5, 32.2, 37.2, 46.9, 59.6, 65.1, 78.4, and 89.4 K, respectively; superconducting transition temp 4.38 K; measured in a magnetic field; in normal state.
8	96	L	1950	2.6-4.2	2-5		Very pure; in superconducting state.
9	96	L	1950	2.6-7.9	2-5		Very pure; measured in a magnetic field; in normal state.
10	182	L	1959	373-773	5		99.896 Ta, 0.0300 Nb, 0.0140 O, 0.0100 W, 0.0100 Zn, 0.0060 N, 0.0050 Mo, 0.0025 C, 0.0025 H, 0.0030 each of Pb, Sn, and Zr, 0.0020 each of Co, Sr, and V, 0.0010 each of Al, Ba, Bi, Cr, Fe, and Ni, 0.0005 each of Ag and Ti, 0.0003 each of B, Mn, Si, and Na, 0.0002 Be, and 0.0001 each of Ca, Cu, and Mg; specimen bar machined from a rod obtained from Fansteel Metallurgical Corp; data taken from smoothed curve.
11	255	E	1960	2343-3148		1	< 0.02 Si, 0.005 Fe, 0.003 Mo, 0.0008 C, and 0.052 others; prepared by pressing and sintering tantalum powder, then hot and cold rolled.
12	255	E	1960	2326-3071		2	0.0032-0.005 O, 0.0035 Nb, 0.0028 Fe, 0.0016 C, < 0.001 N, and 0.0175 others; cast in vacuum, cold rolled, swaged, and cold drawn.
13	97	L	1952	2.3-21	2-3	JM3804; Ta1	99.98 pure; 1-2 mm dia x 5 cm long; obtained from Johnson Matthey Co.; measured in a magnetic field; in normal state.
14	97	L	1952	2.3-3.9	2-3	Ta 1	The above specimen in superconducting state.
15	705	L	1962	0.23-1.2	5	Ta II	Single crystal; specimen dia 6.1 mm; ratio of length to cross sectional area 16.6 cm^{-1}; obtained by floating zone melting polycrystalline rod in a vacuum; electrical resistivity ratio $\rho(298K)/\rho_0 = 47.0$.

SPECIFICATION TABLE NO. 54 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	400	L	1953	0.60-0.86		Ta 1	99.98 pure; polycrystalline; effected by "frozen in" magnetic field; in superconducting state.
17	400	L	1953	0.79-1.0		Ta 1	Separate run of the above specimen; in superconducting state.
18	401	L	1959	4.4-114		Ta 3	99.9 pure; specimen consisted of four 1.5 mm wires supplied by Fansteel Metallurgy Corp; annealed in vacuum at 2500 C; ideal electrical resistivity reported as 0.0032, 0.017, 0.051, 0.12, 0.23, 0.54, 0.95, 1.43, 1.96, 2.50, 3.03, 3.55, 4.6, 5.6, 6.65, 7.65, 8.6, 9.6, 11.0, 12.1, and 13.1 μohm cm at 10, 15, 20, 25, 30, 40, 50, 60, 70, 80, 90, 100, 120, 140, 160, 180, 200, 220, 250, 273, and 295 K, respectively; electrical resistivity ratio $\rho(295K)/\rho_0 = 62.1$.
19	412	L	1955	0.42-1.2		JM3804	99.98 pure; polycrystalline; in superconducting state.
20	501	L	1961	0.95-4.3			0.005 Fe, 0.003 Si, 0.0003 O, and 0.00025 H; single crystal; specimen obtained by floating-zone melting polycrystalline rod; electrical resistivity ratio $\rho(298K)/\rho_0 = 63$; measured in a magnetic field; in normal state.
21	501	L	1961	0.95-4.4			The above specimen in superconducting state.
22	501	L	1961	0.92-4.0			0.1 Nb, 0.01 C, 0.01 Fe, 0.01 Mo, 0.01 W, 0.001 O, 0.00075 N, and 0.00045 H; polycrystalline; electrical resistivity ratio $\rho(298K)/\rho_0 = 31$; measured in a magnetic field; in normal state; specimen same as that used by Rosenberg in 1955 (curve 7).
23	501	L	1961	1.0-4.3			The above specimen in superconducting state.
24	599	E	1961	299-1000		No. 9	99.9 pure; obtained from Fansteel Metallurgical Corp; density 16.4 g cm^{-3}; electrical resistivity reported as 15.1, 34.3, 35.0, 41.3, 48.2, and 49.8 μohm cm at 297, 670, 685, 840, 980, and 1000 K, respectively.
25	652	L,C	1961	323-523		JM 615	Spectrographically standardized tantalum; obtained from John Matthey and Co.; about 4.5 mm in dia and 10 cm long; electrical resistivity reported as 14.5, 15.45, 17.72, 22.25, and 24.4 μohm cm at 293, 323, 373, 473, and 523 K, respectively; Armco iron used as the comparative material.
26	709	E	1962	1233-2793			1 mm in dia, 30 mm long; electrical resistivity reported as 50, 73, 89, and 109 μohm cm at 900, 1500, 2000, and 2500 C, respectively.
27	654	P	1965	1460-2829	± 5		~99.89 Ta (by difference), <0.1 Nb, <0.01 C, and traces of other elements; 0.040 in. thick sheet; obtained from Murex Co.; vacuum beam melted; average grain size after testing 140 μ; density 16.6 g cm^{-3}; thermal conductivity values calculated from measured data of thermal diffusivity using the specific heat data of Kubaschewski, O. and Evans, L. Ll., (Metallurgical Thermochemistry, London, Pergamon, 1956).
28	24	E	1943	273, 373	10-90		99.9 pure; wire 0.01 in. in dia and ~15.7 in. long (40 cm); obtained from Fansteel Corp; electrical resistivity reported as 2.46, 12.41, and 17.18 μohm cm at 77.33, 273.2, and 373.4 K, respectively; measured in a vacuum of 10^{-6} mm Hg.

SPECIFICATION TABLE NO. 54 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
29	849	-	1966	1578-2007		No. 1	0.0019 C, 0.0017 H, 0.0017 N, and 0.0017 O; specimen 2.4892 cm in dia and 0.3927 cm thick; avg. grain size 0.26 mm; density 16.65 g cm^{-3}; thermal conductivity derived from the temp distribution on the flat surface of the cylindrical disc specimen heated in high vacuum (10^{-6} mm Hg) by high frequency induction.
30	849	-	1966	1700-2398		No. 2	0.0655 O, 0.0137 C, 0.0016 N, and 0.00027 H; machined from the same bar as the above specimen; 2.2232 cm in dia and 0.2125 cm thick; density 16.63 g cm^{-3}; measuring method same as above.
31	849	-	1966	1660-2490		No. 3	0.0114 O, 0.0016 N, 0.003 C, and 0.00027 H; machined from the same bar as the above specimen; 2.2232 cm in dia and 0.2018 cm thick; avg. grain size 1.04 mm dia; density 16.62 g cm^{-3}; measuring method same as above.
32	849	-	1966	1563-2142		No. 4	0.0036 O, 0.0018 N, 0.0009 H, and 0.00005 C; machined from the same bar as the above specimen; 1.9075 cm in dia and 0.2316 cm thick; avg. grain size 1.23 mm dia; density 16.63 g cm^{-3}; measuring method same as above.
33	313	T	1962	300-995			No details given for the specimen; thermal conductivity measured by the "small area contact method".

REMARKS

The recommended values are for well-annealed 99.9⁺% pure tantalum with residual electrical resistivity ρ_0 = 0.212 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.10, α' = 4.52 x 10^{-4}, and β = 6.69. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature, and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or interpolated.

THERMAL CONDUCTIVITY OF TELLURIUM

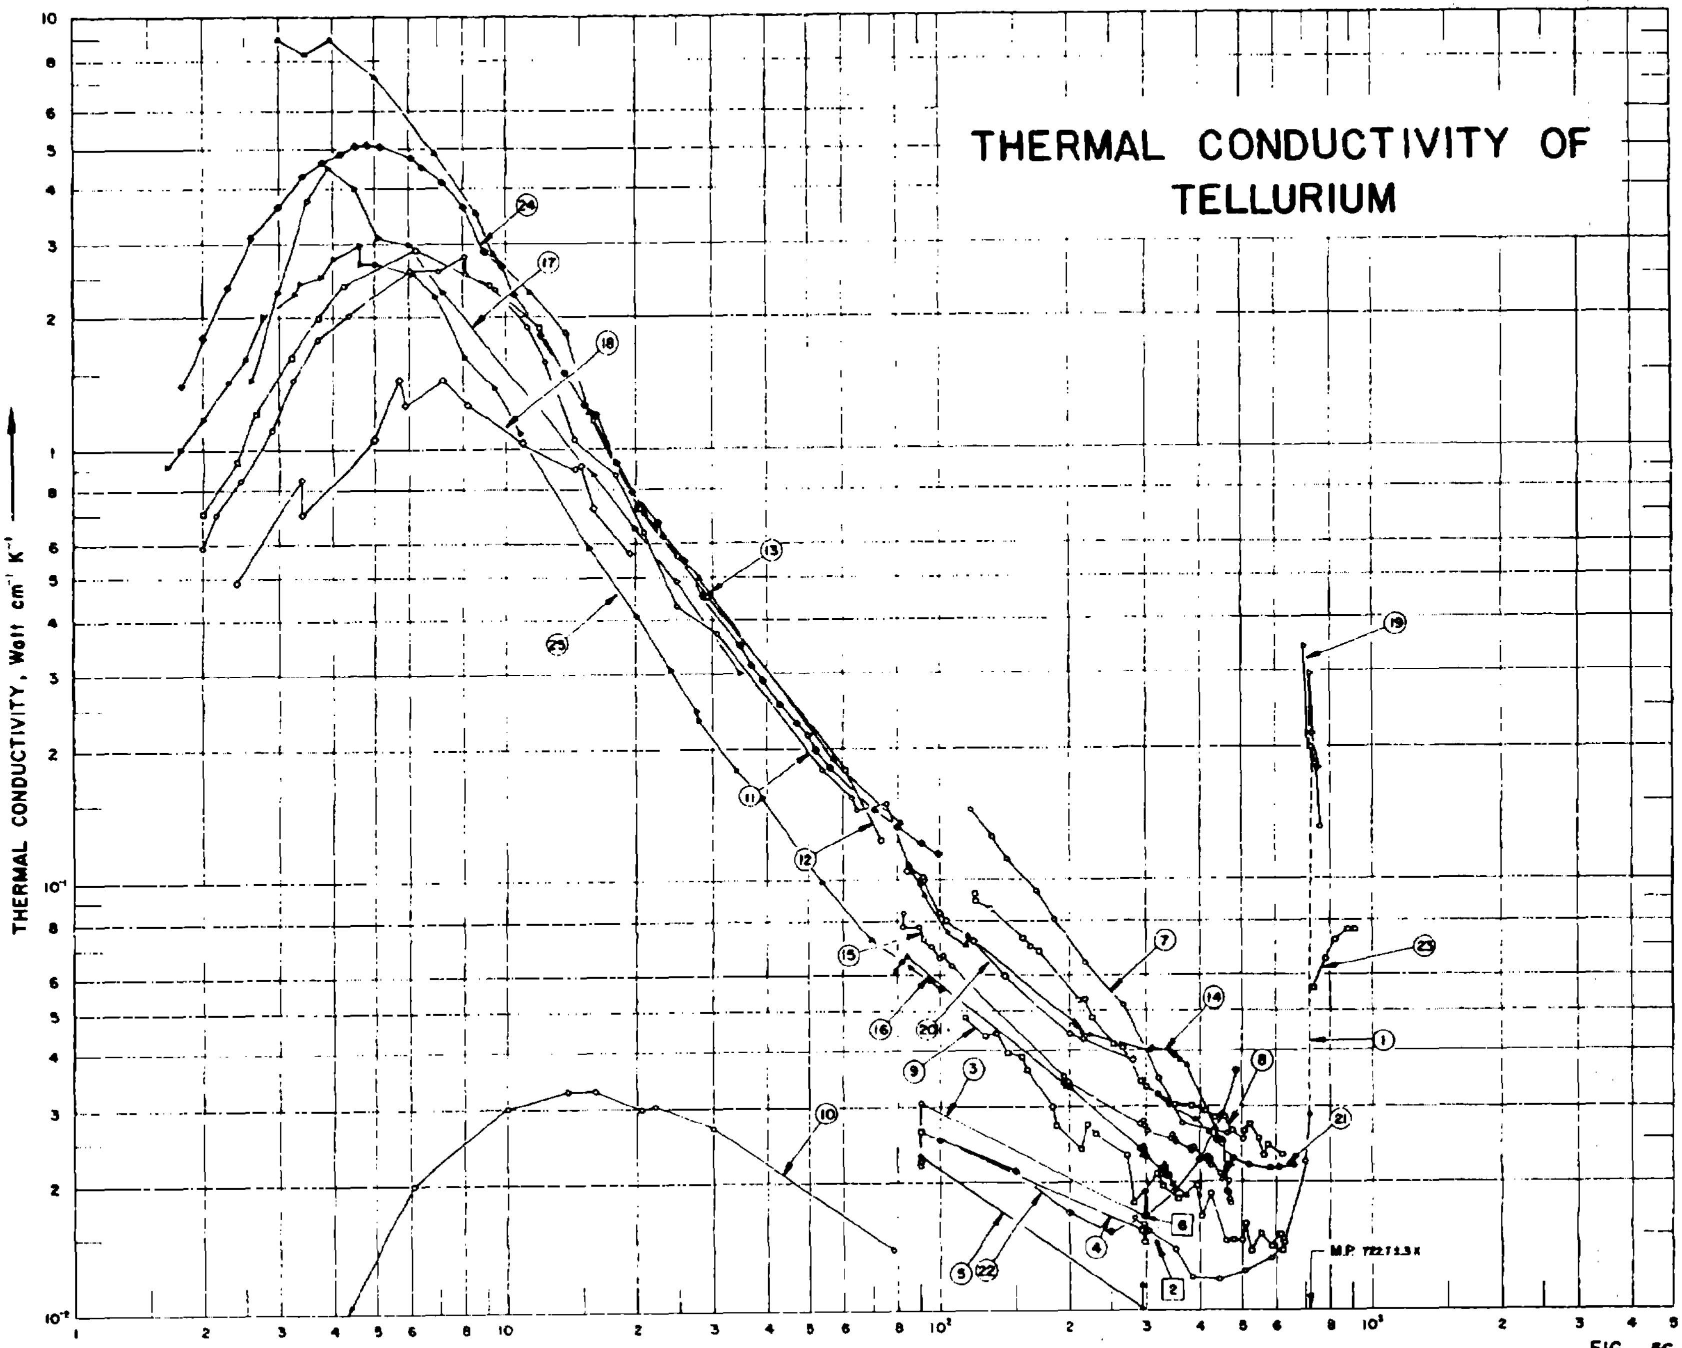

FIG 56

SPECIFICATION TABLE NO. 56 THERMAL CONDUCTIVITY OF TELLURIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 56]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	297	L	1957	285-763	1-5		Spectrally pure; polycrystalline; bar specimen prepared by triple fractional distillation in a vacuum of 10^{-4} mm Hg, cold pressing under 4000 kg cm^{-2}, and hot pressing at 673 K under 380 kg cm^{-2} for 6 hrs; melting point 452 C; measured in both solid and liquid states.
2	366	P	1916	318.5			Material supplied by Eimer and Amend; melted and cast in a hydrogen atmosphere; density 6.25 g cm^{-3}; thermal conductivity value calculated from measured thermal diffusivity using specific heat value taken from literature.
3	367	L	1933	90-298			<0.01 impurities; single crystal; electrical resistivity reported as 0.021 and 0.035 ohm cm at 90 and 298 K, respectively; heat flow parallel to crystal axis.
4	367	L	1933	90-299			<0.01 impurities; polycrystalline; cast; electrical resistivity 0.030 ohm cm at 296 K.
5	367	L	1933	90-296			<0.01 impurities; polycrystalline; cast; electrical resistivity 0.200 ohm cm at 296 K.
6	368	L, C	1954	298.2	0.2-3		15 mm dia disk; electrical resistivity reported as 0.235 ohm cm at 298 K; concentration of current carriers = 3.46×10^{16} cm^{-3}.
7	369		1959	118-462		1	Single crystal; tempered in vacuum for 24 hrs at 673 K; heat flow parallel to principal crystal axis.
8	369		1959	122-622		2	Single crystal; heat flow parallel to principal crystal axis.
9	369		1959	115-622		3	Single crystal; heat flow perpendicular to principal crystal axis.
10	370	l	1957	2.0-78		Te 1	~99.5 pure; polycrystalline; 5 mm dia, 1.5 cm long; broken from a longer rod; supplied by Messrs. A.D. MacKay, Inc.
11	370	L	1957	2.0-92		Te 2	99.99 pure; polycrystalline; individual crystals 1 or 2 mm wide and up to 1 cm long; specimen 3 mm in dia, ~5 cm long, fabricated from pure crystalline lump supplied by Messrs. A.D. MacKay, Inc., zone refined, etched, melted under vacuum in Pyrex tube and allowed to recrystallize.
12	370	L	1957	2.0-74		Te 3	Similar to above but the specimen composed of only 5 or 6 crystals of larger size.
13	370	L	1957	3.0-82		Te 5	The above specimen annealed for about 5 days at a temp just below the melting point, then cooled slowly for 24 hrs to produce a single crystal; crystallographic axis at about 80° to the axis of cylindrical specimen.
14	371	L	1959	85-472		I	Single crystal; 0.72 x 1.06 x 1.95 cm; hole concentration 1×10^{18} cm^{-3}; heat flow in direction of main crystallographic axis.
15	371	L	1959	83-471		II	Single crystal; 0.48 x 0.84 x 1.67 cm; prepared by recrystallization of Te distilled two or three times, slow cooling in a sealed evacuated ampule made of high melting-point glass; hole concentration 9×10^{16} cm^{-3}; heat flow in direction of main crystallographic axis.
16	371	L	1959	80-373		III	Sb-doped; single crystal; 0.77 x 0.80 x 2.03 cm; prepared in same manner as the above specimen, except some antimony added to the twice-distilled tellurium; hole concentration 5×10^{18} cm^{-3}.

SPECIFICATION TABLE NO. 56 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
17	801	L	1962	2.6-35		No. 1	Single crystal; 28 x 0.31 x 0.3 cm; specimen axis along principal crystal axis; prepared by zone melting; annealed for 70 hrs at 593 K, etched in SR-4; carrier concentration 3 x 10^{14} cm^{-3} at 77 K.
18	801	L	1962	2.4-20		No. 2	Single crystal; 17 x 0.36 x 0.33 cm; specimen axis along principal crystal axis; prepared by zone melting; etched in HNO_3; carrier concentration 7 x 10^{14} cm^{-3} at 77 K.
19	802	-	1962	696-750			Pure; liquid specimen contained in a sealed Pyrex glass vessel; electrical resistivity reported as 0.77, 0.68, 0.58, 0.49, 0.48, 0.45, 0.44, and 0.41 milliohm cm at 394, 404, 433, 469, 472, 496, 502, and 528 C, respectively; data corrected for conduction of heat through the current lead.
20	803	L	1963	84-280	5-8	No. 1	Single crystal; specimen cut from single crystal ingot obtained by slow cooling of molten tellurium in a sealed evacuated ampoule; annealed in sealed ampoule for 90 hrs at 613 K; hole concentration ~2 x 10^{15} cm^{-3} at 80 K; measured under atm. of argon, with heat flow along the c-axis.
21	803	C	1963	320-660	5-8	No. 1	The above specimen measured by a comparative method using fused quartz as comparative material.
22	804	C	1961	100-485			99.6 pure; polycrystalline; specimen 0.3 cm long and 0.5 cm in dia; hole concentration 3 x 10^{16} cm^{-3} (as calculated from Hall effect); brass (38.5 Zn, 61.5 Cu) used as comparative material; data taken from smoothed curve of 4 measurements.
23	914	L	1966	743-823			99.995 pure; molten specimen contained in a short cylindrical cell.
24	961	L	1967	1.8-98			Single crystal; specimen 2.09 mm^2 in cross section and 1.45 mm long; heat flow parallel to the c-axis; (additional information and the tabulated data obtained from author).
25	961	L	1967	1.7-101			Single crystal; specimen 2.418 mm^2 in cross section and 1.55 mm long; heat flow perpendicular to the c-axis; (additional information and the tabulated data obtained from author).

REMARKS

The recommended values are for 99.99% pure tellurium. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures above 10 K. The thermal conductivity near and below the corresponding temperature of its maximum is highly sensitive to small physical and chemical variations of the specimens, and the values below 10 K are intended as typical values for indicating the general trend.

* T_1 in K, k_1 in Watt cm⁻¹ K⁻¹, T_2 in F, and k_2 in Btu hr⁻¹ ft⁻¹ F⁻¹.

‡ Values in parentheses are extrapolated or estimated.

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	777	C	1965	291.2	±3.0		High purity; polycrystalline; specimen 0.25 in. in dia and 0.25 in. long; supplied by Johnson Matthey Co.; electrical resistivity reported as 119 μohm cm at about 18 C; monel metal used as comparative material; measurements made using 2 different thermal comparators.
2	816	L	1964	6.0-300			0.08 O, 0.06 Y, 0.01 Cu, 0.01 Si, and 0.003 Mg; polycrystalline; specimen 0.476 cm in dia and 6 cm long; supplied by Research Chemicals; arc-melted for 12 min, machined, swaged, heated in vacuum of 10^{-5} mm Hg at 790 K for 40 hrs and cooled to room temp in about 3 hrs; measured in vacuum of 6×10^{-6} mm Hg; electrical resistivity reported as 4.851, 5.006, 5.843, 7.041, 11.196, 14.998, 19.637, 23.504, 28.815, 41.320, 57.922, 85.109, 105.708, 112.480, 116.077, 117.000, 119.308, 121.842, and 123.686 μohm cm at 4.18, 12.62, 20.09, 25.37, 37.21, 45.71, 55.37, 63.13, 73.61, 97.72, 128.29, 175.61, 212.73, 223.27, 231.13, 241.45, 264.35, 287.39, and 303.59 K, respectively; ferromagnetic-antiferromagnetic and antiferromagnetic-paramagnetic transition occurred at 219 K and 230 K respectively.
3	814		1966	2.0-99		Tb 1	99.9 pure; specimen 0.25 mm in dia; baked for 1.5 hrs at 650 C; measured in helium atmosphere; electrical resistivity 4.13 μohm cm at 4.2 K; electrical resistivity ratio $\rho(293K)/\rho(4.2K)$ = 30; data taken from smoothed curve.
4	814		1966	2.0-99		Tb 2	99.9 pure; specimen 0.25 mm in dia; baked for 1.5 hrs at 650 C; measured in helium atmosphere; electrical resistivity 7.90 μohm cm at 4.2 K; electrical resistivity ratio $\rho(293K)/\rho(4.2K)$ = 15.6; data taken from smoothed curve.

REMARKS

The recommended values are for well-annealed 99.84% pure terbium with residual electrical resistivity ρ_0 = 4.85 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

SPECIFICATION TABLE NO. 58 THERMAL CONDUCTIVITY OF THALLIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 58]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	34	L	1927	80, 273			Pure thallium (electrolytic); electrical conductivity reported as 27.8 and 6.73 x 10^4 $ohm^{-1} cm^{-1}$ at 80 and 273 K respectively.
2	19	L	1923	318-422			Cylindrical specimen 1.5 cm in dia and 12 cm long; melting point 302 C.
3	122	L	1955	2.1-31		JM 2544; Tl1	99.99 pure; polycrystalline; 2.99 cm long and 0.16 cm in dia; supplied by Johnson Mathey and Co.; annealed in vacuo for several hrs and coated with celluloid varnish to prevent oxidation; measured in a magnetic field; in normal state.
4	122	L	1955	2.0-2.3		JM 2544; Tl1	The above specimen in superconducting state.
5	342	L	1953	2.8-4.4		JM 2544; Tl1	99.99 pure; polycrystalline; 5 cm long and ~0.2 cm in dia; supplied by Johnson Matthey and Co.; measured in a transverse magnetic field of 0.34 kOe.
6	342	L	1953	3.4, 4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 0.34 kOe.
7	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 0.51 kOe.
8	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 0.71 kOe.
9	342	L	1953	4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 0.71 kOe.
10	342	L	1953	2.8-4.4		Tl 1	The above specimen measured in a transverse magnetic field of 1.09 kOe.
11	342	L	1953	3.4, 4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 1.09 kOe.
12	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 1.42 kOe.
13	342	L	1953	4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 1.42 kOe.
14	342	L	1953	2.8-4.4		Tl 1	The above specimen measured in a transverse magnetic field of 1.79 kOe.
15	342	L	1953	3.4, 4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 1.79 kOe.
16	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 2.14 kOe.
17	342	L	1953	4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 2.14 kOe.
18	342	L	1953	2.8-4.4		Tl 1	The above specimen measured in a transverse magnetic field of 2.5 kOe.
19	342	L	1953	3.4, 4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 2.5 kOe.
20	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 2.85 kOe.
21	342	L	1953	4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 2.85 kOe.
22	342	L	1953	2.8-4.4		Tl 1	The above specimen measured in a transverse magnetic field of 3.22 kOe.
23	342	L	1953	3.4, 4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 3.22 kOe.
24	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 3.59 kOe.
25	342	L	1953	4.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 3.59 kOe.
26	342	L	1953	3.4		Tl 1	The above specimen measured in a longitudinal magnetic field of 3.70 kOe
27	342	L	1953	4.4		Tl 1	The above specimen measured in a transverse magnetic field of 3.79 kOe.

SPECIFICATION TABLE NO. 58 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
28	342	L	1953	3.4		Tl 1	The above specimen measured in a transverse magnetic field of 3.82 kOe.
29	342	L	1953	2.8		Tl 1	The above specimen measured in a transverse magnetic field of 3.91 kOe.
30	400	L	1953	0.29-0.63		Tl 1	The above specimen measured at low temperatures; in superconducting state; preliminary results reported.
31	412	L	1955	0.26-0.84	±5	Tl 1	More complete results from the same thallium batch (JM 2544) as the above specimen; in superconducting state.
32	230	L	1925	333			Specimen 1.9 cm in dia, 10 cm long; made from pure thallium from Eimer and Amend; electrical conductivity 5.88×10^4 ohm^{-1} cm^{-1} at 25 C.
33	712	L	1961	0.41-4.2		Tl-3	Pure; specimen 1 mm in dia; made from single crystal; specimen axis at 20 degrees with the crystal hexagonal axis; residual electrical resistivity 0.0026 μohm cm.
34	712	L	1961	0.19-5.2		Tl-4	Pure; specimen 1.1 mm in dia; made from single crystal; specimen axis at 80 degrees with the crystal hexagonal axis; residual electrical resistivity 0.0050 μohm cm.
35	712	L	1961	0.21-5.6		Tl-7	Pure; specimen 1.6 mm in dia; specimen axis at 30 degrees with the crystal hexagonal axis; residual electrical resistivity 0.00024 ± 0.00003 μohm cm.
36	712	L	1961	0.34-5.3		Tl-8	0.9 mm in dia; obtained by etching the above specimen; residual electrical resistivity 0.00045 μohm cm.

REMARKS

The recommended values are for well-annealed high-purity thallium with residual electrical resistivity ρ_0 = 0.000289 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 60 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.25, α' = 2.27₅ x 10⁻³, and β = 0.00982. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

*T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡Values in parentheses are extrapolated or interpolated.

SPECIFICATION TABLE NO. 59 THERMAL CONDUCTIVITY OF THORIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 59]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	94, 266		1951	373-923		Ames thorium	Specimen hot rolled at 733 C and air cooled; density 11.6 g cm^{-3}; melting point 1680 ± 25 C; data determined in an atmosphere of purified argon.
2	130, 778	P	1951	301-697			99.85 pure; specimen 0.125 in. in dia, ~50 cm long; thermal conductivity values calculated from measured data of thermal diffusivity using density 11.558 g cm^{-3}, and specific heat of 0.1188 joules $g^{-1}C^{-1}$ (from C.F. Miller).
3	422, 239		1945	338-623			Specimen made from Ames extruded thorium.
4	235, 239	L	1944	335-367			Pure; specimen 1.618 cm long, cross sectional area 5.042 cm^2.
5	423		1945	293-573			Specimen ~6 cm long, 1 cm in dia; manufactured by Westinghouse Lamp Co.; x-ray analysis after test showed the presence of thorium oxide (probably formed during the test); electrical resistivity reported as 27.5 and 32 μ ohm cm at 20 and 100 C, respectively; Lorenz function 2.76 and 2.68 x 10^{-8} V^2K^{-2} at 20 and 100 C, respectively.
6	935	L	1965	5.3-94	5		Cylindrical specimen 4 mm in dia and 30 mm long; supplied by Dr. J.A. Lee, A.E.R.E. Harwell; machined from an ingot or argon-arc-melted van Arkel metal of high purity; electrical resistivity ratio $\rho(273\ K)/\rho(4.2\ K)$ = 20.49; electrical resistivity reported as 0.75, 0.91, 1.26, 1.82, 2.39, 2.97, 4.06, 5.15, 14.7, and 15.9 μ ohm cm at 10, 20, 30, 40, 50, 60, 80, 100, 273.15, and 295 K, respectively; residual electrical resistivity 0.72 μ ohm cm; Lorenz function reported as 2.85, 2.67, 2.45, 2.28, 2.24, 2.49, 2.82, and 3.02 x 10^{-8} V^2K^{-2} at 5, 15, 18, 25, 30, 50, 75, and 100 K, respectively; thermal conductivity data averaged from the results of several separate runs.

REMARKS

The recommended values are for well-annealed high-purity thorium with residual electrical resistivity $\rho_0 = 0.72\ \mu\Omega$ cm (characterization by ρ_0 becomes important below room temperature). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 10 to 15% of the true values.

* T_1 in K, k_1 in Watt $cm^{-1} K^{-1}$, T_2 in F, and k_2 in Btu $hr^{-1} ft^{-1} F^{-1}$.

REMARKS

The recommended values are for well-annealed 99.9⁺% pure thulium with residual electrical resistivity ρ_0 = 3.5 and 1.7 $\mu\Omega$ cm along the directions parallel and perpendicular to the c-axis of the single crystal, respectively (characterization by ρ_0 becomes important at temperatures below about 200 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

---

* T in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated.

SPECIFICATION TABLE NO. 61 THERMAL CONDUCTIVITY OF TIN

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 61]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	85	L	1919	381-771			Pure; in both solid and liquid states.
2	117	L	1949	1.4-3.7		Sn I	99.992+ pure; single crystal; 2.3 mm dia; made of Chempur tin (99.992 pure) purified further by several times melting in vacuo. crystalizing and etching; measured with heat flow at 85 degrees to the tetragonal axis; in superconducting state.
3	117	L	1949	3.8-4.1		Sn I	The above specimen in normal state.
4	117	L	1949	1.3-3.6		Sn II	Single crystal; 0.8 mm dia x 70 mm long; made of Chempur tin purified further by several times melting in vacuo, crystalizing and etching; electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 16700$; measured with heat flow at 85 degrees to the tetragonal axis; in superconducting state.
5	117	L	1949	1.5-3.7		Sn II	The above specimen measured in a magnetic field of strength 510 Oe; in normal state.
6	19	L	1923	323-620			Specimen in both solid and liquid states; 12 cm long and 1.5 cm in dia; melting point 232 C.
7	98	L	1908	99-303			Pure; from Kahlbaum; density 7.28 g cm^{-3} at 21 C; electrical resistivity reported as 3.00 and 10.65 μohm cm at -170.4 and 11.6 C, respectively.
8	122	L	1955	2.3-3.6	3	Sn 1	99.997 pure; single crystal; 2.95 cm long, 0.389 cm in dia; supplied by Johnson, Matthey Co. Ltd.; measured in a magnetic field; in normal state.
9	122	L	1955	2.3-3.6	3	Sn 1	The above specimen in superconducting state.
10	457	L	1949	1.8-4.4	3	Sn 2	99.997 Sn (by difference), 0.003 impurities; polycrystalline; measured in a longitudinal magnetic field; in normal state.
11	457	L	1949	1.8-3.5	3	Sn 2	The above specimen in superconducting state.
12	457	L	1949	1.8-4.4	3	Sn 3	99.967 Sn (by difference), 0.033 Hg; polycrystalline; measured in a longitudinal magnetic field; in normal state.
13	457	L	1949	1.8-3.4	3	Sn 3	The above specimen in superconducting state.
14	270	P	1915	308.2			Specimen 25 cm long, 0.25 cm in dia; thermal conductivity value calculated from measured thermal diffusivity using the values of density and specific heat taken from the Tabellen of Landolt and Bornstein.
15	342	L	1953	4.4		Sn 1	99.997 pure; single crystal; supplied by Johnson, Matthey Co. Ltd.; measured in transverse magnetic fields with strength H ranging from 0.19 to 3.57 kOe.
16	342	L	1953	3.0		Sn 1	The above specimen measured in transverse magnetic fields with strength H ranging from 0.29 to 3.57 kOe.
17	342	L	1953	2.4		Sn 1	The above specimen measured in transverse magnetic fields with strength H ranging from 0.35 to 3.75 kOe.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
18	342	L	1953	2.4		Sn 1	The above specimen measured in longitudinal magnetic fields with strength H ranging from 0.29 to 3.75 kOe.
19	342	L	1953	3.0		Sn 1	The above specimen measured in longitudinal magnetic fields with strength H ranging from 0.35 to 3.66 kOe.
20	342	L	1953	4.4		Sn 1	The above specimen measured in longitudinal magnetic fields with strength H ranging from 0.35 to 3.75 kOe.
21	74	L	1950	2.21	3	Sn 2	99.996 pure; homogenous solid solution with few large crystals; superconducting transition point 3.71 K; measured in magnetic fields with strength H ranging from 62 to 1453 gauss.
22	74	L	1950	4.29	3	Sn 2	The above specimen measured in magnetic fields with strength H ranging from 62 to 1453 gauss.
23	74	L	1950	2.42	3	Sn 3	99.967 pure; homogeneous solid solution with few large crystals; superconducting transition point 3.68 K; measured in magnetic fields with strength H ranging from 123 to 1213 gauss.
24	412	L	1955	0.39-0.65			99.997 pure; single crystal; supplied by Johnson, Matthey Co. Ltd.; in superconducting state (same specimen as used for curve No. 8).
25	412	L	1955	0.25-0.80			99.997 pure; polycrystalline; supplied by Johnson, Matthey Co. Ltd.; in superconducting state.
26	460		1957	373.2			Electrical conductivity 6.6 x 10^4 $ohm^{-1} cm^{-1}$ at 100 C.
27	230	L	1925	327			0.03 total impurities; specimen 10 cm long and 1.9 cm in dia; electrical conductivity 8.96 x 10^4 $ohm^{-1} cm^{-1}$ at 22 C.
28	452	L	1955	0.2-4.2	2-4	JM 4600; Sn2	Spectroscopically pure; single crystal with tetragonal axis parallel to rod axis; 2.530 mm dia rod supplied by Johnson, Matthey Co. Ltd.; cast and recrystallized; superconducting state.
29	452	L	1955	1.7-3.5	2-4	JM 4600; Sn2	The above specimen measured in a longitudinal field of 400 gauss; in normal state; data corrected for magneto-conductivity.
30	452	L	1955	0.40-0.64	2.4	JM 4600; Sn3	Similar to the above specimen but the dia 5.11 mm; in superconducting state.
31	452	L	1955	0.34-0.71	2-4	JM 4600; Sn4	Similar to the above specimen but with tetragonal axis at 88° to the rod axis, and rod dia 2.135 mm; in superconducting state.
32	452	L	1955	0.24-1.2	2-4	JM 4600; Sn5	Pure; polycrystalline; specimen dia 2.315 mm; cast, recrystallized, and strained grain size 0.50 mm; in superconducting state.
33	290	L	1952	1.59		Sn II	99.996 pure; polycrystal with several large crystals; 4.1 mm dia rod; prepared from Johnson-Matthey tin, J.M. Lab No. 2356; electrical resistivity ratio $\rho(273K)/\rho(4.2K)$ ~ 8000; measured in increasing transverse magnetic fields with strength H ranging from zero to 303 gauss.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
34	290	L	1952	1.59		Sn II	The above specimen measured in decreasing transverse magnetic fields with strength H ranging from 246 to 120 gauss.
35	290	L	1952	2.21		Sn II	The above specimen measured in increasing transverse magnetic fields with strength H ranging from zero to 273 gauss.
36	290	L	1952	2.21		Sn II	The above specimen measured in decreasing transverse magnetic fields with strength H ranging from 255 to zero gauss.
37	290	L	1952	2.53		Sn II	The above specimen measured in increasing transverse magnetic fields with strength H ranging from zero to 240 gauss.
38	290	L	1952	2.53		Sn II	The above specimen measured in decreasing transverse magnetic fields with strength H ranging from 149 to zero gauss.
39	290	L	1952	2.18		Sn IV	99.996 pure; single crystal with its tetragonal axis at about 70° from the geometric axis; 4.3 mm dia rod; prepared from Johnson-Matthey tin. J. M. Lab No. 2356; electrical resistivity ratio $\rho(273K)/\rho(4.2K) = 11000$; measured in increasing transverse magnetic fields with strength H ranging from zero to 272 gauss and field direction nearly parallel to the tetragonal axis.
40	290	L	1952	2.18		Sn IV	The above specimen measured in decreasing transverse magnetic fields nearly parallel to the tetragonal axis with strength H ranging from 181 to zero gauss.
41	290	L	1952	2.86		Sn IV	The above specimen measured in increasing transverse magnetic fields with strength H ranging from zero to 204 gauss and field direction at about 20° with the tetragonal axis.
42	290	L	1952	2.86		Sn IV	The above specimen measured in decreasing transverse magnetic fields with strength H ranging from 115 to zero gauss and field direction at about 20° with the tetragonal axis.
43	290	L	1952	3.62		Sn IV	The above specimen measured in transverse magnetic fields with strength H ranging from zero to 2620 gauss and field direction at about 20° with the tetragonal axis.
44	290	L	1952	1.27			99.866 pure; 0.134 Bi; polycrystalline; specimen 5.0 mm in dia; prepared from Johnson-Matthey materials; measured in increasing transverse magnetic fields with strength H ranging from zero to 304 gauss.
45	290	L	1952	1.27			The above specimen measured in decreasing transverse magnetic fields with strength H ranging from 237 to zero gauss.
46	285	L	1952	2.5			Spectroscopically pure; polycrystal with a few large crystals; 3-4 mm dia x ~ 10 cm long; prepared from Johnson-Matthey tin; measured in increasing transverse magnetic fields with strength H ranging from zero to 238.2 gauss.
47	285	L	1952	2.5			The above specimen measured in decreasing transverse magnetic fields with strength H ranging from 149.7 to zero gauss.
48	404, 738	L	1950	2.7-5.6	4	Sn I	99.996⁺ pure; single crystal; supplied by Johnson-Matthey Co. Ltd.; specimen 8 cm long, 4 mm in dia; in superconducting state below transition temperature.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
49	404, 738	L	1950	2.1-4.7	4	Sn II	Similar to the above specimen but with a dia of 2 mm; in superconducting state below transition temperature.
50	404, 738	L	1950	2.18	4	Sn II	The above specimen measured in longitudinal magnetic fields with strength H ranging from zero to 455.2 gauss.
51	404, 738	L	1950	3.19	4	Sn II	The above specimen measured in longitudinal magnetic fields with strength H ranging from zero to 258.7 gauss.
52	404, 738	L	1950	3.32	4	Sn II	The above specimen measured in longitudinal magnetic fields with strength H ranging from zero to 376.1 gauss.
53	404, 738	L	1950	3.77	4	Sn II	The above specimen measured in longitudinal magnetic fields with strength H ranging from zero to 375.2 gauss.
54	404, 738	L	1950	4.38	4	Sn II	The above specimen measured in longitudinal magnetic fields with strength H ranging from zero to 532 gauss.
55	404, 738	L	1950	5.02	4	Sn II	The above specimen measured in longitudinal magnetic fields with strength H ranging from zero to 434.5 gauss.
56	404, 738	L	1950	2.2-3.7	4	Sn II	The above specimen; superconducting transition point 3.69 K; measured in a magnetic field; in normal state.
57	406	C	1922	313.2	5		Pure; specimen 3 cm long and 3 cm in dia; zinc used as comparative material.
58	431	E	1941	390-460			Single crystal; electrical resistivity reported as 14.45, 15.30, 15.80, 17.55, 18.03 and 18.94 μ ohm cm at 390.2, 404.4, 412.0, 439.5, 447.6, and 460.2 K, respectively.
59	315, 457	L	1957	2.4-4.3	2	1	0.197 Bi; 4 mm dia rod; annealed for several months; electrical resistivity reported as 0.0721 and 11.69 μ ohm cm. at 4.2 and 300 K, respectively; measured in a magnetic field of ~560 gauss; in normal state.
60	458	L	1958	2.1-4.0	5	Sn 1	99.9 pure, monocrystalline; 1.89 mm dia rod; polished; in superconducting state.
61	458	L	1958	0.11-4.2	5	Sn 2	99.998 pure; monocrystalline; 1.72 mm dia rod with rough surface; angle between specimen axis and [001] direction 30°; in superconducting state.
62	458	L	1958	2.3-3.7	5	Sn 2	The above specimen in normal state.
63	458	L	1958	0.12-1.4	5	Sn 3	99.998 pure; monocrystalline; 1.40 mm dia rod with rough surface; angle between specimen axis and [001] direction 70°; in superconducting state.
64	458	L	1958	0.11-0.92	5	Sn 4	99.998 pure; monocrystalline; 1.81 mm dia rod with polished surface; angle between specimen axis and [001] direction ~45°; in superconducting state.
65	[illegible]	L	1953	0.47-0.61		Sn 2	99.997 pure; polycrystalline; effected by "frozen in" magnetic field; in superconducting state.
66	[illegible]	L	1953	0.37-0.71		Sn 2	99.997 pure; polycrystalline; in superconducting state.
67	[illegible]	L	1953	0.33-0.80		Sn 1	99.997 pure; single crystal; in superconducting state.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
68	459	P	1905	286.7			Chemically pure; specimen in ring form; cast and turned; density 7.31 g cm^{-3} at 14 C; electrical resistivity 11.82 μ ohm cm at 13.5 C; thermal conductivity value calculated from measured data of thermal diffusivity and specific heat.
69	454	L	1958	0.21-0.52	2	E 0	Spectroscopically pure; single crystal; 4.91 mm dia rod with specimen axis at 85° to the tetrad axis; provided by Johnson Matthey Co. Ltd.; cast, crystallized, and electro-polished to 0.05 μ in surface roughness; in superconducting state.
70	454	L	1958	0.21-0.52	2	E 1	The above specimen 50% clouding etched by exposure to HCl fumes; surface roughness 0.3 μ; in superconducting state.
71	454	L	1958	0.26-0.51	2	E 2	The above specimen lightly etched to 0.7 μ in surface roughness; in superconducting state.
72	454	L	1958	0.25-0.53	2	E 3	The above specimen etched to 1.1 μ in surface roughness; in superconducting state.
73	454	L	1958	0.21-0.47	2	E 4	The above specimen electro-polished 0.05 μ in surface roughness and 4.75 mm in dia; in superconducting state.
74	454	L	1958	0.21-0.47	2	E 5	The above specimen 25% clouding etched by exposure to HCl fumes; surface roughness 0.12 μ; in superconducting state.
75	454	L	1958	0.25-0.52	2	E 6	The above specimen electro-polished to 0.10 μ in surface roughness and 3.15 mm in dia; in superconducting state.
76	454	L	1958	0.24-0.53	2	E 7	The above specimen etched to 1.0 μ in surface roughness; in superconducting state.
77	454	L	1958	0.27-0.65	2	E 10	The above specimen electro-polished, etched, annealed at 220 C, then again etched to 1.0 μ in surface roughness and 1.96 mm in dia; residual electrical resistivity 0.00377 μ ohm cm; in superconducting state.
78	454	L	1958	0.24-0.66	2	D 0	Spectroscopically pure; 2.82 mm dia rod consisted of 3 large crystals; as cast; surface roughness 0.10 μ; residual electrical resistivity 0.0014 μ ohm cm; in superconducting state.
79	454	L	1958	0.26-0.63	2	D 1	The above specimen etched to 0.7 μ in surface roughness; in superconducting state.
80	455	L	1953	0.18-0.67	10-25	Sn II	Spectroscopically pure; polycrystalline; 1.3 mm dia rod made up of crystals of the order of the dia; cast in tube; in superconducting state.
81	455	L	1953	0.23-0.90	10-25	Sn III	Similar to the above specimen but with dia 0.7 mm; in superconducting state.
82	682	L	1960	0.13-4.0			0.002 impurity; single crystal; 0.175 cm in dia and ~50 mm long; cast in vacuo in thin-walled glass capillary in which crystallization took place immediately after casting; electrical resistivity ratio $\rho(293K)/\rho_0$ ~ 6250; in superconducting state below transition point.
83	592	L	1959	570-833			In molten state; melting point 231.9 C.
84	597, 708	L	1961	337-610	2-5		99.94 pure; in both solid and liquid states.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
85	509	C	1954	306-378	± 3	56 B-1	Specimen made from NBS freezing-point tin No. 42b (freezing point 231.9 C); 0.500 in. dia x 0.500 in. long; electrolytically deposited pure copper used as comparative material; reference data of copper taken from International Critical Tables (Vol. 5, McGraw Hill Book Co., New York, p. 221, 1929).
86	511	L	1958	298.0			Specimen with radius of 0.7 cm furnished by the manufacturer Erba; measured in atmospheric pressure.
87	504	P	1961	295.2	± 5		Rectangular plate 1.9 x 1.9 x 0.306 cm; supplied by Armco; thermal conductivity value calculated from measured thermal diffusivity using values of density and specific heat taken from Smithsonian Physical Tables (9th ed., 1954).
88	712	L	1961	2.9-4.6		Sn-1	High purity; single crystal; 2.6 mm in dia; specimen axis in the [001] orientation; residual electrical resistivity ρ_0=(1 ± 0.5) x 10^{-4} μ ohm cm; superconducting transition point 3.72 K; measured in a longitudinal magnetic field; in normal state; data corrected to zero field.
89	712	L	1961	1.9-3.7		Sn-1	The above specimen in superconducting state.
90	712	L	1961	2.6-4.4		Sn-2	Similar to the above specimen but 1.1 mm dia and residual electrical resistivity ρ_0=(1.65 ± 0.2) x 10^{-4} μ ohm cm; measured in a longitudinal magnetic field; in normal state; data corrected to zero field.
91	712	L	1961	0.6-3.7		Sn-2	The above specimen in superconducting state.
92	712	L	1961	2.3-4.7		Sn-3	Similar to the above specimen but 1.5 mm in dia and residual electrical resistivity ρ_0=6.1 x 10^{-4} μ ohm cm; measured in a longitudinal magnetic field; in normal state; data corrected to zero field.
93	712	L	1961	2.0-3.7		Sn-3	The above specimen in superconducting state.
94	712	L	1961	2.8-4.5		Sn-4	High purity; single crystal; 2.1 mm in dia; specimen axis in the [110] orientation; residual electrical resistivity ρ_0=(1.2 ± 0.5) x 10^{-4} μ ohm cm; measured in a longitudinal magnetic field.
95	712	L	1961	2.5-3.7		Sn-4	The above specimen in superconducting state.
96	706	L	1881	273,373			Density 7.27 g cm^{-3}; electrical conductivity reported as 9.346 and 8.524 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
97	739	L	1961	2.7-4.3		Sn 1	High purity; single crystal; rod specimen about 14 cm long made from 2 mm dia extruded wire; nominal orientation [001]; rod along the tetrad axis; specimen crystallized by slow cooling, etched in concentrated HCl; electrical resistivity ratio $\rho(293K)/\rho_0$ = 80000; measured in a magnetic field; in normal state.
98	739	L	1961	2.8-4.2		Sn 2	Similar to the above specimen but made from 5 parts of Johnson, Matthey Specpure and 8 parts of high purity tin from Vulcan De-tinning Co.; electrical resistivity ratio $\rho(293K)/\rho_0$ = 23000; measured in a magnetic field; in normal state.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
99	739	L	1961	2.7-4.2		Sn 4	Similar to the above specimen but made from equal parts of Johnson, Matthey Specpure and Vulcan De-tinning Co. high purity tin; electrical resistivity ratio $\rho(293K)/\rho_0$ = 4500; measured in a magnetic field; in normal state.
100	740	L	1965	0.34-1.3	< 10		99.99$^+$ pure; single crystal; specimen 2.2 mm in dia and 100 mm long; residual electrical resistivity $\rho(4.2K)$ - 1.7 x 10^{-10} ohm cm in superconducting state.
101	740	L	1965	0.48-1.3	< 10		The above specimen measured in a longitudinal magnetic field of 500 oersteds; in normal state.
102	740	L	1965	0.45-1.2	< 10		The above specimen measured in a transverse magnetic field of 500 oersteds; in normal state.
103	740	L	1965	0.39-1.5	< 10		0.05 mm tin foil produced by rolling tin having the same purity as the above specimen; in superconducting state.
104	740	L	1965	0.42-2.0	< 10		The above specimen measured in a longitudinal magnetic field of 330 oersteds; in normal state.
105	740	L	1965	0.36-1.7	< 10		Similar to the above specimen but the foil had been preliminarily etched; in superconducting state.
106	740	L	1965	0.43-1.4	< 10		The above specimen measured in a longitudinal magnetic field of 330 oersteds; in normal state.
107	735, 839	P	1965	870-1230	6-8		Molten specimen filled in the space between 2 coaxial tantalum tubes of dia 23.8 and 8 mm, each tube 0.12 mm thick; thermal conductivity values calculated from measured data of thermal diffusivity and specific heat using data of density taken from M.P. Slavinskii, (Physicochemical Properties of Elements [Russian] 1952).
108	744	P	1966	465-1365	7		Molten specimen filled in the space between two coaxial thin-walled tantalum tubes of 24 and 8 mm dia, respectively; thermal conductivity values calculated from measured data of thermal diffusivity and specific heat.
109	838	C	1966	429-773			Molten specimen placed in a hole of 21 mm in dia drilled in an asbestos cement cylinder of 30 mm height; 1Kh18N9T steel used as comparative material.
110	837	L	1967	1.6-4.5	1	Sn 1	99.999 pure; supplied by Johnson-Matthey; extruded into 1.5 mm dia wire; electrical resistivity reported as 0.00213 and 13.06 μohm cm at 4.2 and 273 K, respectively; superconducting transition temperature 3.720 K; below the transition temperature, a longitudinal magnetic field was applied to the specimen; in normal state.
111	837	L	1967	1.6-3.6	1	Sn 1	The above specimen measured with the magnetic field removed; in superconducting state.
112	837	L	1967	1.6-4.5	1	Pb 1	0.019 Pb; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Pb, extruding into 1.5 mm dia wire; annealed at ~200 C for several days; electrical resistivity reported as 0.00564 and 12.71 μohm cm at 4.2 and 273 K, respectively; superconducting transition point 3.716 K; measured in a longitudinal magnetic field; in normal state.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
113	837	L	1967	2.2-3.6	1	Pb 1	The above specimen measured without the magnetic field; in superconducting state.
114	837	L	1967	1.6-4.6	1	Pb 2	0.174 Pb; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Pb, extruding into 1.5 mm dia wire; annealed at ~200 C for several days; electrical resistivity reported as 0.0500 and 13.19 μ ohm cm at 4.2 and 273 K, respectively; superconducting transition point 3.713 K; measured in longitudinal magnetic field; in normal state.
115	837	L	1967	1.4-3.7	1	Pb 2	The above specimen measured without the magnetic field; in superconducting state.
116	837	L	1967	1.3-4.5	1	Bi 1	0.012 Bi; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Bi, extruding into 1.5 mm dia wire; annealed at ~200 C for several days; electrical resistivity reported as 0.00578 and 12.61 μ ohm cm at 4.2 and 273 K, respectively; superconducting transition point 3.725 K; measured in a longitudinal magnetic field, in normal state.
117	837	L	1967	1.4-3.7	1	Bi 1	The above specimen measured without the magnetic field; in superconducting state.
118	837	L	1967	1.4-4.4	1	Bi 2	0.140 Bi; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Bi, extruding into 1.5 mm dia wire; annealed at ~200 C for several days; electrical resistivity reported as 0.0721 and 11.91 μ ohm cm at 4.2 and 273 K, respectively; superconducting transition point 3.709 K; measured in a longitudinal magnetic field; in normal state.
119	837	L	1967	2.2-3.7	1	Bi 2	The above specimen measured without the magnetic field; in superconducting state.
120	837	L	1967	1.6-4.7	1	Hg 1	0.018 Hg; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Hg, extruding into 1.5 mm dia wire; annealed at ~200 C for several days; electrical resistivity reported as 0.0203 and 12.87 μ ohm cm at 4.2 and 273 K, respectively; superconducting transition point 3.718 K; measured in a longitudinal magnetic field; in normal state.
121	837	L	1967	1.7-3.7	1	Hg 1	The above specimen measured without the magnetic field; in superconducting state.
122	837	L	1967	1.4-4.0	1	Hg 2	0.168 Hg; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Hg, extruding into 1.5 mm dia wire; annealed at ~200 C for several days; electrical resistivity reported as 0.113 and 11.28 μ ohm cm at 4.2 and 273 K, respectively; superconducting transition point 3.686 K; measured in a longitudinal magnetic field; in normal state.
123	837	L	1967	1.4-3.6	1	Hg 2	The above specimen measured without the magnetic field; in superconducting state.
124	836	L	1958	1.6-4.6	4-5	2	0.047 Hg; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Hg, casting into 1 mm dia x 12 cm long wire in a pyrex capillary; residual electrical resistivity 0.014 μ ohm cm; measured in a magnetic field; in normal state.
125	836	L	1958	1.6-4.2	4-5	2	The above specimen measured without the magnetic field; in superconducting state.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
126	836	L	1958	1.6-4.8	4-5	5	0.049 Bi; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Bi, casting into 1 mm dia x 12 cm long wire in a pyrex capillary; residual electrical resistivity 0.020 μ ohm cm; measured in a magnetic field; in normal state.
127	836	L	1958	1.5-2.8	4-5	5	The above specimen measured without the magnetic field; in superconducting state.
128	836	L	1958	1.6-4.9	4-5	8	0.040 Pb; prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Pb, casting into 1 mm dia x 12 cm long wire in a pyrex capillary; residual electrical resistivity 0.010 μ ohm cm; measured in a magnetic field; in normal state.
129	836	L	1958	1.6-2.6	4-5	8	The above specimen measured without the magnetic field; in superconducting state.
130	835	L	1966	1.65	± 4	Sn 5.0	Polycrystalline; 2.25 mm dia x 10 cm long; supplied by Johnson-Matthey and Co.; specimen recrystallized in an alumina packing; annealed at a temperature just below the melting point for several hrs; electrical resistivity ratio $\rho(290K)/\rho(4.2K)$ = 5000; measured in a transverse static magnetic field with strength ranging from 72 to 277 gauss.
131	835	L	1966	1.65	± 4	Sn 5.0	The above specimen measured with the field rotated about the specimen axis 10 times at 5 sec rev^{-1} between points of measurement.
132	835	L	1966	1.80	± 4	Sn 47	Single crystal with tetrad axis at 3 degrees to the specimen axis; 2.15 mm dia x 10 cm long; same preparation procedure as the above specimen; electrical resistivity ratio $\rho(290K)/\rho(4.2K)$ = 47000; measured in a transverse static magnetic field with strength ranging from 76 to 227 gauss.
133	835	L	1966	1.80	± 4	Sn 47	The above specimen measured with the field rotated about the specimen axis 5 times at 8 sec rev^{-1} between points of measurement.

505.06	0.662	38.3	0.460	26.6	0.595	34.4	449.44

REMARKS

The recommended values are for well-annealed 99.999⁺% pure white tin with residual electrical resistivity ρ_0 = 0.000120, 0.000172, and 0.000133 $\mu\Omega$ cm, respectively, for single crystal along directions perpendicular and parallel to the c-axis and for polycrystalline tin (characterization by ρ_0 becomes important at temperatures below about 150 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature and 3 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated, interpolated, or estimated.

[For Data Reported in Figure and Table No. 62]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	122	L	1955	2.6-99	5-10	Ti 3	99.99 pure; single crystal.
2	97	L	1952	2.3-22	2-3	Ti 1	99.9 pure; polycrystalline; supplied by Associated Electrical Industries Research Laboratories.
3	97	L	1952	2.3-38	2-3	Ti 2	99.99 pure; polycrystalline; same supplier as above; annealed.
4	441		1957	312-799	3	Iodide Titanium	99.9 pure; annealed in vacuum at 700 C for 5 hrs; electrical resistivity reported as 53.8, 50.3, 67.2, 79.0, 90.0, 100.2, and 115.0 μohm cm at 38.9, 116.0, 196.0, 264.0, 259.3, 445.7, and 526.0 C, respectively.
5	441		1957	315-732			Forged titanium specimen 99.6 pure; annealed in vacuum at 700 C for 5 hrs; electrical resistivity reported as 65.8, 58.8, 73.5, 84.0, 98.2, and 107.5 μohm cm at 41.5, 126.6, 201.6, 278.3, 376.6, and 459.0 C, respectively.
6	131	C	1953	323-973	2		0.1 Mn, 0.04 Fe, 0.035 C, and 0.01 Mg; annealed at 700 C; Advance (55 Cu-45 Ni) used as comparative material.
7	231, 304	C	1958	311-811	< 5	A-55 (RC-55)	Commercially pure; in a mill-annealed condition; electrical resistivity reported as 52, 63, 72, 83, 92, 101, 110, 118, 125, and 132 μohm cm at 311, 366, 422, 477, 533, 589, 644, 700, 755, and 811 K, respectively; measured in a vacuum of 5 x 10^{-5} mm Hg.
8	742	E	1964	388-923			99.6 pure (Russian commercial titanium); obtained from the Central Boiler and Turbine Institute; specimen 5 mm in dia and 100 mm long; experiment carried out in vacuum (10^{-4} - 10^{-5} mm Hg); electrical resistivity reported as 47, 64, 82, 99, 117, 133, 143 and 145 μohm cm at 0, 100, 200, 300, 400, 500, 600 and 650 C, respectively.
9	340	L	1956	332-915	10	Ti 75 A(1)	Commercially pure; 0.75 in. dia rod.
10	340	L	1956	383-858	10	Ti 75 A(2)	99.75 Ti, 0.131 O, 0.07 Fe, 0.06 C, 0.048 N, and 0.0068 H; 0.75 in. dia rod.
11	340	L	1956	375-838	10	RC-55	99.64 Ti, 0.123 O, and 0.12 Fe, 0.0073 H, 0.08 C, and 0.028 N; 0.75 in. dia rod.
12	401	L	1959	7.3-150		Ti 3	99.99 pure; specimen cross section 3.1 x 1.6 mm; supplied by Winegard; annealed in vacuum for 60 hrs at 800 C; ideal electrical resistivity reported as 0.020, 0.075, 0.20, 0.65, 1.4, 2.3, 3.5, 4.85, 6.35, 7.9, 11.2, 14.8, 18.5, 22.1, 25.7, 29.3, 34.8, 39.0, and 43.1 μohm cm at 20, 25, 30, 40, 50, 60, 70, 80, 90, 100, 120, 140, 160, 180, 200, 220, 250, 273, and 295 K, respectively; electrical resistivity ratio ρ_{295K}/ρ_0 ≈ 21.9; Lorenz function 2.74 x 10^{-8} $V^2 K^{-2}$ near 0 K.
13	401	L	1959	11-78		Ti 4	99.99 pure; as rolled; electrical resistivity ratio ρ_{295K}/ρ_0 = 16.4; ideal electrical resistivity 43.8 μohm cm at 295 K; Lorenz function 2.81 x 10^{-8} $V^2 K^{-2}$ near 0 K.
14	401	L	1959	7.0-147		Ti 5	99.99 pure; annealed in vacuum for 60 hrs at 800 C; electrical resistivity ratio ρ_{295K}/ρ_0 = 18.3; ideal electrical resistivity 43.2 μohm cm at 295 K; Lorenz function 3.14 x 10^{-8} $V^2 K^{-2}$ near 0 K.
15	672	±P	1964	9-70			99.9 pure; data taken from smoothed curve.

SPECIFICATION TABLE NO. 62 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	683	L	1963	0.3-0.9			Single crystal.
17	698	L, C	1961	323-573		Sample A	Normal commercial grade; electrical resistivity reported as 56.0, 65.0, 73.5, 82.5, 90.5 and 98.5 μohm cm at 50, 100, 150, 200, 250, and 300 C, respectively; energy flow measured both calorimetrically and by using Armco iron as a comparative material.
18	698	L, C	1961	323-573		Sample B	High purity grade; electrical resistivity reported as 51.8, 60.8, 70.0, 79.2, 88.4, and 97.5 μohm cm at 50, 100, 150, 200, 250, and 300 C, respectively; energy flow measured both calorimetrically and by using Armco iron as a comparative material.
19	698	L, C	1961	293.2		Sample C	Very high purity grade; DPN (Diamond Pyramid Hardness Number) 58-62; electrical resistivity 42.7 μohm cm at 20 C; energy flow measured both calorimetrically and by using Armco iron as a comparative material.

REMARKS

The recommended values are for well-annealed 99.99⁺% pure titanium with residual electrical resistivity ρ_0 = 1.70 $\mu\Omega$ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.6, α' = 4.32 x 10^{-5}, and β = 69.5. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated, interpolated, or estimated.

SPECIFICATION TABLE NO. 63 THERMAL CONDUCTIVITY OF TUNGSTEN

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 63]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	150	L	1957	1.8-119		W 1b	0.01 Mo, traces of Fe, Si and Cu; 4 mm dia rod; annealed in vacuum at 1350 C; electrical resistivity ratio $\rho(295K)/\rho_0$ = 169; residual electrical resistivity 0.0315 μohm cm.
2	57	L	1927	21, 83		W 1	High purity; single crystal; electrical resistivity reported as 0.00589 and 0.681 μohm cm at -252 and -190 C, respectively.
3	57	L	1927	21, 83		W 2	Less pure than the above specimen; single crystal; electrical resistivity reported as 0.266, 1.024, and 5.29 μohm cm at -252, -190, and 0 C, respectively.
4	16	L	1936	16-22			Very pure; electrical resistivity ratio $\rho(273K)/\rho_0 = 2.18 \times 10^3$.
5	8	F	1914	290, 373		Pladuram	Pure; 0.0600 cm dia x 28.5 cm long; electrical resistivity reported as 5.206 and 7.562 μohm cm at 0 and 100 C, respectively.
6	24	E	1943	77-373		2	High purity; 0.0250 cm dia x 40.85 cm long; drawn; aged at 2400 and 2600 C; electrical resistivity reported as 0.6736, 0.9132, 3.18, 5.034, and 7.392 μohm cm at 77.4, 90.2, 193, 273.2, and 372.8 K, respectively.
7	24	E	1943	77-373		8	High purity; 0.0250 cm dia x 40.00 cm long; drawn; aged at 2300 C; electrical resistivity reported as 0.6135, 0.8558, 5.035, and 7.429 μohm cm at 77.36, 90.2, 273.2, and 373.1 K, respectively.
8	99	E	1936	78-273			Commercially pure; 0.00254 cm dia x 14.8 cm long; aged at white heat for several hrs in vacuum, etched; Lorenz function reported as 2.12, 2.68, and 3.48 $V^2 K^{-2}$ at 78, 194, and 273 K, respecitvely; measured in a vacuum of $< 10^{-6}$ mm Hg.
9	87	E	1936	240-600			Pure; 0.00499 cm dia wire; annealed at 2400 K; data taken from smoothed curve.
10	78	E	1931	276-280	2		Commercially pure; 0.1022 cm dia x 17.63 cm long; supplied by General Electric Co.; annealed at 220 C; electrical conductivity 16.7×10^4 $ohm^{-1} cm^{-1}$ at 273 K; measured in a vacuum of $< 10^{-4}$ mm Hg.
11	78	E	1931	276-286	2		Commercially pure; 0.1022 cm dia x 19.96 cm long; supplied by General Electric Co.; annealed at 1300 C; electrical conductivity 17.7×10^4 $ohm^{-1} cm^{-1}$ at 273 K; measured in a vacuum of $< 10^{-4}$ mm Hg.
12	153	E	1914	1500-2500			Pure; 0.0209 cm dia filament; data taken from smoothed curve.
13	97	L	1952	2.8-43	2-3	JM2260; W1	99.99 pure; polycrystalline; annealed.
14	106	E	1941	1100-2000			Traces of metallic impurities; aged at 2700 K for 2 hrs; electrical resistivity reported as 30.0, 35.5, 42.3, 49.4, 58.2, and 66.6 μohm cm at 1180, 1350, 1570, 1800, 2050, and 2300 K, respectively; data taken from smoothed curve.
15	79	E	1933	90-373		W:	99.96⁺ W, traces of Si, Ta and V; single crystal; 7.846 cm x 0.01053 cm^2; electrical resistivity reported as 0.892, 3.22, 4.98, and 7.35 μohm cm at -183.00, -78.50, 0, and 100 C, respectively; heat flow parallel to crystal axis.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
16	79	E	1933	90-373		W2	99.96⁺ W, traces of Si, Ta and V; single crystal; 7.940 cm x 0.01022 cm^2; electrical resistivity reported as 0.843, 3.17, 4.94, and 7.29 µohm cm at -183.00, -78.50, 0, and 100 C, respectively; heat flow at 45 degrees to the crystal axis.
17	62	L	1938	15-88			High purity; single crystal; specimen axis in [111] direction; electrical resistivity reported as 0.00236, 0.00315, 0.00417, 0.00422, 0.1425, 0.3230, 0.3475, 0.3565, 0.3945, 0.4230, 0.4460, 0.4990, 0.5110, 0.5595, 0.6065, 0.7040, and 0.8070 µohm cm at 14.14, 17.55, 20.36, 20.42, 50.55, 63.50, 65.20, 65.80, 68.20, 69.80, 71.30, 74.30, 74.95, 77.40, 80.10, 85.05, and 90.15 K, respectively.
18	44	E	1925	1500-2500			Pure; density 19.3 g cm^{-3} at room temp; electrical resistivity reported as 5.64, 8.06, 13.54, 19.47, 25.70, 32.02, 38.52, 45.22, 52.08, 59.10, 66.25, 73.55, 81.0, 88.5, 96.2, 103.8, 111.7, and 115.7 µohm cm at 300, 400, 600, 800, 1000, 1200, 1400, 1600, 1800, 2000, 2200, 2400, 2600, 2800, 3000, 3200, 3400, and 3500 K, respectively.
19	272	L	1957	3.4-76		I-38	Pure single crystal; specimen axis in [100] direction; electrical resistivity reported as 0.0123, 0.0141, 0.2155, 0.3551, 0.4297, 0.5087, and 0.5921 µohm cm at 14.50, 20.42, 55.35, 63.95, 68.51, 72.97, and 77.35 K, respectively; heat flow parallel to (±5°) the crystal axis.
20	255	E	1960	2400-3194		1	0.04 Mo, 0.006 O, 0.005 Ti, 0.005 Ni, 0.004 Fe, and 0.027 others; prepared by pressing and sintering metal powder; hot-worked.
21	255	E	1960	2344-3451		2	99.95 W, 0.04 Mo, 0.002 Cu, and 0.008 others; prepared by pressing and sintering metal powder; hot-worked.
22	398	L	1949	15-20			High purity; single crystal; specimen axis in [111] direction; electrical resistivity reported as 0.319, 0.281, 0.236, and 0.187 µohm cm at 14.20, 15.98, 18.05, and 20.48 K, respectively; heat flow at 45 degrees to crystal axis; measured in a field of 10.3 kilooersteds perpendicular to specimen axis.
23	398	L	1949	15-20			As above but measured in a field of 26.39 kilooersteds; electrical resistivity reported as 1.932, 1.810, 1.677, 1.527, 1.382, 1.239, and 1.060 µohm cm at 14.21, 15.07, 15.96, 17.02, 18.06, 19.11, and 20.48 K, respectively.
24	398	L	1949	15-20			As above but measured in a field of 32.65 kilooersteds; electrical resistivity reported as 2.926, 2.737, 2.541, 2.317, 2.099, 1.882, and 1.594 µohm cm at 14.20, 15.07, 15.98, 17.02, 18.04, 19.08, and 20.51 K, respectively.
25	398	L	1949	15-20			As above but measured in a field of 36.27 kilooersteds; electrical resistivity reported as 3.572, 3.347, 3.106, 2.565, and 1.967 µohm cm at 14.21, 15.07, 15.99, 18.05, and 20.45 K, respectively.
26	62	L	1938	15-20			High purity; single crystal; specimen axis parallel to (1,1,1) direction; measured in a transverse magnetic field of 25.85 kilogauss perpendicular to specimen axis.
27	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 21.83 kilogauss.
28	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 18.96 kilogauss.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
29	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 16.69 kilogauss.
30	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 13.82 kilogauss.
31	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 11.44 kilogauss.
32	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 8.18 kilogauss.
33	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 5.22 kilogauss.
34	62	L	1938	15-20			The above specimen measured in a transverse magnetic field of 2.61 kilogauss.
35	259	E	1959	1600-2700			Spectrographically pure; 0.010 in. dia; electrical resistivity reported as 46.4, 53.3, 63.3, 71.4, and 83.7 μohm cm at 1622, 1925, 2230, 2471, and 2965 K, respectively.
36	448	L	1937	22-91		W 1	7 cm x 0.106 cm^2; specimen axis at 8 degrees to the [110] direction; measured in a vacuum of 10^{-4}-10^{-6} mm Hg.
37	448	L	1937	21.7		W 1	Measured at H (the transverse magnetic field strength) = 4850 oersteds and θ (the angle between the magnetic field direction and a line perpendicular to the rod axis) = -90° at which H parallel to [111] direction.
38	448	L	1937	27.8		W 1	The above specimen measured at H = 6730 oersteds and θ = -90°.
39	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = -90°.
40	448	L	1937	21.7		W 1	The above specimen measured at H = 6100 oersteds and θ = -60°.
41	448	L	1937	21.7		W 1	The above specimen measured at H = 6100 oersteds and θ = -50°.
42	448	L	1937	21.7		W 1	The above specimen measured at H = 6100 oersteds and θ = -40°.
43	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = -20°.
44	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = 0° at which H perpendicular to [111] direction.
45	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +20°.
46	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +40°.
47	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +60°.
48	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +70°.
49	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +80°.
50	448	L	1937	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +90°.
51	448	L	1937	21.7		W 1	The above specimen measured at H = 4850 oersteds and θ = +70°.
52	448	L	1937	21.6		W 1	The above specimen measured at H = 2520 oersteds and θ = +70°.
53	448	L	1937	21.5		W 1	The above specimen with the magnetic field removed.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
54	436	L	1938	22.2		W 1	Specimen axis in [110] direction; electrical resistivity 0.00463 μohm cm at -252.83 C; measured at H (the transverse magnetic field strength) = 0 and θ (the angle between the magnetic field direction and a line perpendicular to the rod axis) = -56° at which H parallel to [110] direction.
55	436	L	1938	21.7		W 1	The above specimen measured at H = 6100 oersteds and θ = -56°.
56	436	L	1938	21.5		W 1	The above specimen measured at H = 12200 oersteds and θ = -56°.
57	436	L	1938	21.5		W 1	The above specimen measured at H = 0 oersteds and θ = +70° at which H perpendicular to [111] direction.
58	436	L	1938	21.6		W 1	The above specimen measured at H = 2520 oersteds and θ = +70°.
59	436	L	1938	21.7		W 1	The above specimen measured at H = 4850 oersteds and θ = +70°.
60	436	L	1938	21.8		W 1	The above specimen measured at H = 6100 oersteds and θ = +70°.
61	436	L	1938	21.8		W 1	The above specimen measured at H = 12200 oersteds and θ = +70°.
62	436	L	1938	21.0		W 13a	Specimen axis in [100] direction; electrical resistivity 0.01054 μohm cm at -252.82 C; measured at H (the transverse magnetic field strength) = 0 and θ (the angle between the magnetic field direction and a line perpendicular to the rod axis) = -5° at which H nearly parallel to [100] direction.
63	436	L	1938	20.8		W 13a	The above specimen measured at H = 2280 oersteds and θ = -5°; electrical resistivity 0.01980 μohm cm at -252.82 C.
64	436	L	1938	21.0		W 13a	The above specimen measured at H = 4490 oersteds and θ = -5°; electrical resistivity 0.0346 μohm cm at -252.82 C.
65	436	L	1938	21.4		W 13a	The above specimen measured at H = 8750 oersteds and θ = -5°; electrical resistivity 0.0760 μohm cm at -252.82 C.
66	436	L	1938	21.0		W 13a	The above specimen measured at H = 10880 oersteds and θ = -5°; electrical resistivity 0.1044 μohm cm at -252.82 C.
67	436	L	1938	21.0		W 13a	The above specimen measured at H = 11080 oersteds and θ = -5°.
68	436	L	1938	21.1		W 13a	The above specimen measured at H = 12200 oersteds and θ = -5°.
69	436	L	1938	21.0		W 13a	The above specimen measured at H = 0 oersteds and θ = -50° at which H parallel to [110] direction.
70	436	L	1938	20.8		W 13a	The above specimen measured at H = 2280 oersteds and θ = -50°.
71	436	L	1938	21.0		W 13a	The above specimen measured at H = 4490 oersteds and θ = -50°.
72	436	L	1938	21.1		W 13a	The above specimen measured at H = 8750 oersteds and θ = -50°.
73	436	L	1938	21.0		W 13a	The above specimen measured at H = 10880 oersteds and θ = -50°.
74	436	L	1938	21.1		W 13a	The above specimen measured at H = 12200 oersteds and θ = -50°.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
75	449	L	1917	274.2			0.1 mm dia; tempered for 20 hrs at 225 C; electrical resistivity 0.204 μohm cm at 1 C; Lorenz function 2.88 x 10^{-8} V^2 K^{-2} at 1 C.
76	602	E	1961	1173-2473	< 6		Spectrally pure; two 2.2 mm dia wires used as the test materials; shaped and preliminarily annealed in a high vacuum at 1700 C for 1 hr; electrical resistivity reported as 29.8, 33.1, 38.4, 45.3, 52.0, 59.5, 67.3, and 76.7 μohm cm at 900, 1000, 1200, 1400, 1600, 1800, 2000, and 2200 C, respectively; measured in a high vacuum.
77	579	L	1936	16-22			No details reported.
78	603	R	1962	559-860	2-4	C-54	0.003 Fe, 0.0026 Si, 0.0020 O, 0.0010 S, 0.0010 P and Ni, Cu, H and N; specimen 0.75 in. O.D., 0.25 in. I.D., and 0.75 in. long; arc-cast; maximum exposure temp 2255 C; density 18.87 g cm^{-3} (98.4% of theoretical).
79	603	R	1962	484-1287	2-4	C-55	The above specimen; 2nd run.
80	603	R	1962	1555-1872	2-4	C-85	Similar to the above specimen.
81	603	R	1962	1571-2939	2-4	C-86	Similar to the above specimen; the specimen melted at temp beyond 2255 C (probably because of the carbon eutectic formation, the carbon might come from furnace vapor).
82	651	E	1925	1800-2800			Pure wire.
83	652	C	1961	323-673		JM 740	Spectrographically standardized tungsten; JM 740 of Johnson Mattney and Co.; about 4 mm in dia and 10 cm in length; electrical resistivity reported as 5.45, 6.1, 7.3, 9.8, 12.45, 15.2, 18.1, 21.4, 24.6, 27.8, 30.9, 34.3, 37.7, 41.4, 45.1, 49.7, and 51.8 μohm cm at 20, 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, and 1450 C, respectively; Armco iron used as comparative material.
84	653	E	1963	645-1660			Single crystal.
85	654	P	1965	1300-2900			99.5 pure; impurities: Fe, Mo and traces of other elements; 1.5 mm thick disc cut from a swaged rod; from General Electric Co. Osram Lamp Works; average grain size (after testing) 46 μ; density 19.3 g cm^{-3}; thermal conductivity values calculated from thermal diffusivity measurements using specific heat data of Kubaschewski, O. and Evans, L. L. (Metallurgical Thermochemistry, Pergamon, 1956).
86	669	L	1964	1283-3223			Short rod; electrical resistivity reported as 33.0, 36.0, 39.0, 42.0, 45.2, 48.6, 52.1, 56.0, 59.4, 63.2, 67.0, 71.0, 74.4, 78.0, 81.6, 85.2, 89.0, 92.6, 96.2, and 103.6 μohm cm at 1000, 1100, 1200, 1300, 1400, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, and 3000 C, respectively.
87	656	—	1963	1200-3000			< 0.1% impurities; cylindrical specimen; thermal conductivity values calculated from measured heat flow and specific radiation loss.
88	667	E	1962	1615-2780	±10		Spectrographically pure; 0.10 in. dia; electrical resistivity reported as 40.0, 50.0, 56.6, 66.6, and 80.6 μohm cm at 1545, 1812, 2087, 2363 and 2618 K, respectively; measured in a vacuum of $<10^{-6}$ mm Hg.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
89	668	E	1964	1900			Foil of 60 μ thick; wire rider of 0.2 mm in dia placed on that part of the foil where temp was constant; circular diaphragms used in optical pyrometer system.
90	668	E	1964	1900			Foil of 60 μ thick; rider dia 0.3 mm, circular diaphragms in system.
91	668	E	1964	1900			Foil of 60 μ thick; rider dia 0.2 mm, slit diaphragms in system.
92	668	E	1964	1900			Wire of 0.2 mm in dia; rider dia 0.2 mm, slit diaphragms in system.
93	688	L	1964	317.2	5	LASL; set No. 1, sample 1	An oxide layer on the surface and < 0.0050 oxide inside the specimen; porous right cylinder prepared from tungsten powder obtained from Powder Metallurgical Group of Los Alamos Scientific Lab; material hydrostatically pressed in a plastic sack with 30,000 psi initial pressure, machined and sintered at 1500 C for 2 hrs in a hydrogen reducing atm; particle size 0.8 micron; 72.3% theo. density; electrical resistivity 10.4 μohm cm at 20 C.
94	688	L	1964	323.2	5	LASL; set No. 1, sample 2	Similar to the above specimen except 72.1% theo. density, and 10.6 μohm cm electrical resistivity at 20 C.
95	688	L	1964	326.2	5	LASL; set No. 1, sample 3	Similar to the above specimen except 1350 C sintering temp, 63.2% theo density, and 13.3 μohm cm electrical resistivity at 20 C.
96	688	L	1964	311.2	5	LASL; set No. 1, sample 6	Similar to the above specimen except 1575 C sintering temp, 78.1% theo. density, and 9.1 μohm cm electrical resistivity at 20 C.
97	688	L	1954	311.2	5	LASL; set No. 1, sample 7	Similar to the above specimen except 1625 C sintering temp, 83.6% theo. density, and 8.2 μohm cm electrical resistivity at 20 C.
98	688	L	1964	308.2	5	LASL; set No. 1, sample 11	Similar to the above specimen except sintered at 1700 C for 9 hrs, 95.3% theo. density, 6.2 μohm cm electrical resistivity at 20 C, and the ratio of isolated pores to total pores ≈0.9.
99	688	L	1964	320.2	5	LASL; set No. 1 sample 12	Similar to the above specimen except 95.5% theo. density, and 6.3 μohm cm electrical resistivity at 20 C.
100	688	L	1964	319.2	5	LASL; set No. II, sample 2	Similar to the above specimen except sintered at 1700 C for 3 hrs, particle size 2-4.5 microns, 74.4% theo. density, and 10.5 μohm cm electrical resistivity at 20 C.
101	775	-	1966	1930-2933	~15	S 1	99.8⁺ pure; cylindrical specimen 1.52 in. in dia, 0.502 in. thick; polished; thermal conductivity determined by equating the axial heat flux within the specimen to the radiation flux at the center of the top surface.
102	775	-	1966	2005-2983	~15	S 2	Similar to above except dimensions 1.006 in. dia, 0.504 in. thick.
103	775	-	1966	2138-2978	~15	S 3	Similar to above except dimensions 1.0066 in. dia, 0.356 in. thick.
104	775	-	1966	2086-3075	~15	S 4	Similar to above except dimensions 0.804 in. dia, 0.284 in. thick.
105	775	-	1966	1506-2150	~15	P 1	Unknown purity; cylindrical specimen; 1.52 in. dia, 0.538 in. thick; fabricated by gravity sintering tungsten particles 0.006 to 0.01 in. in size; fired for a long duration at > 2478 K; porosity 55%; thermal conductivity data determined by the same method as above.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
106	775	-	1966	1384-2569	~15	P 2	Similar to above except dimensions 1.45 in. dia, 0.507 in. thick, and 45% porosity.
107	775	-	1966	1366-2894	~15	P 3	Similar to above except dimensions 0.975 in. dia, 0.379 in. thick, and 46% porosity.
108	775	-	1966	1958-2366	~15	P 4	Similar to above except dimensions 1.03 in. dia, 0.302 in. thick, and 42% porosity.
109	775	-	1966	1755-2753	~15	P 5	Similar to above except dimensions 0.80 in. dia, 0.25 in. thick, and 42% porosity.
110	709	E	1962	1173-2473			1 mm in dia, 30 mm long; electrical resistivity reported as 0.295, 0.23, 0.258, and 0.293 μohm cm at 1000, 1400, 1800, and 2200 C, respectively.
111	905, 906	E	1965	1618-2081		Sample No. 1	Foil strip; 2 mm x 60 μ x 20 mm.
112	905, 906	E	1965	1490-1779		Sample No. 2	Foil strip; 3 mm x 60 μ x 20 mm.
113	905, 906	E	1965	1979-2999		Sample No. 3	Specimen 0.3 mm in dia and 20 mm long.
114	905, 906	E	1965	1963-2384		Sample No. 4	Specimen 0.2 mm in dia and 20 mm long.
115	841	L	1967	313-664		I	99.99 W, 0.01 Mo, trace Si and Cu; 0.4 cm dia x 10 cm long; supplied by Johnson Matthey Co.; measured in the intermediate-temp apparatus.
116	841	C	1967	451-751		I	The above specimen measured in the high-temp apparatus; Armco iron used as comparative material.
117	841	C	1967	405-992		II	Similar to above.
118	907, 908	P	1966	1000-2000			99.95 W and 0.035 Mo; forged rod specimen 10 mm in dia and 80 mm long; density 19.17 g cm^{-3}; thermal conductivity values calculated from measured data of thermal diffusivity using specific heat data taken from Hoch, M. and Johnston, H. L. (J. Phys. Chem., 65, 855, 1961).
119	909	C	1966	285-500	± 5	1	0.026 O, 0.010 Mo, < 0.005 Si, 0.001 each of Cu and Ag, < 0.001 each of Al, Ca, Fe, Mg, Mn, and Ni, and < 0.0005 N; tungsten sheets of ~0.060 in. thick supplied by Fansteel Metallurgical Corp; specimen dimensions 1.000 in. dia x 1.250 in. long; squares cut from the sheets clamped together to form cubes, single welds perpendicular to the sheets made at opposite ends with an inert-gas arc welder, machined to size with the sheets parallel to the cylinder axis; thermocouple holes drilled at 75 degrees to the sheets; density 19.21 g cm^{-3} at 26.3 C; Armco iron used as comparative material; measured in a helium atm with diatomaceous insulation.
120	909	C	1966	549-972	± 5	1	Second run of the above specimen with thermatomic carbon insulation.
121	909	C	1966	823-1042	± 5	1	Same as above, third run.
122	909	R	1966	1266-1997	± 7	2	Prepared from the same material as the above specimen; consisted of 32 one-inch dia discs with 0.25 in. holes in their centers, the central 16 discs used as test specimen.
123	909	R	1966	1451-2033	± 7	2	Second run of the above specimen.

SPECIFICATION TABLE NO. 63 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
124	849	–	1966	1513-1930		No. 1	0.0007 C, < 0.0005 each of N and O, and < 0.00005 H; specimen 2.5339 cm in dia and 0.27 cm long; density 18.89 g cm^{-3}; thermal conductivity derived from the temp distribution on the flat surface of the cylindrical disc specimen heated in high vacuum (10^{-5} mm Hg) by high frequency induction.
125	849	–	1966	1572-1905		No. 2	Similar to the above specimen except specimen 2.4785 cm in dia and 0.2714 cm thick with density 19.03 g cm^{-3}.
126	849	–	1966	1836-2608		No. 3	Similar to the above specimen except specimen 2.0801 cm in dia and 0.27 cm thick with avg grain size 0.035 mm dia and density 19.23 g cm^{-3}.
127	996	L	1967	87-377			Spectroscopically standardized; 4 mm dia x 10 cm long; supplied by Johnson Matthey Co.; electrical resistivity reported as 0.24, 0.83, 1.08, 3.32, 5.61, and 7.33 μohm cm at 5, 78, 91, 195, 298, and 374 K, respectively. (Tabulated data received from author.)

REMARKS

The recommended values are for well-annealed 99.99⁺% pure tungsten with residual electrical resistivity ρ_0 = 0.00170 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.40, α' = 2.06 x 10^{-5}, and β = 0.0696. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature, and 3 to 5% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or estimated.

SPECIFICATION TABLE NO. 64 THERMAL CONDUCTIVITY OF URANIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 64]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	46		1958	353, 873			Mg-reduced.
2	46		1958	423, 873			Ca-reduced.
3	32	R	1954	255-867			Pure; cylindrical disc specimen; rolled in the α-phase; as received; data taken from smoothed curve.
4	32	R	1954	255-1033			Pure; cylindrical disc specimen; rolled in the α-phase; heated to 750 C for 10 min in the β-phase, then water quenched; data taken from smoothed curve.
5	139	L	1952	23-278	±5.0		Approx 99.8 pure; specimen in a rod form 0.5 in. in dia and 2.5 in. long; heated at 700 C in a lead bath for 10 min then quenched in water at 50 C; electrical resistivity reported as 4.07, 9.79, 10.4, 9.96, 9.72, 13.3, 13.4, 13.2, 21.6, 21.6, and 28.4 μohm cm at 21.14, 77.60, 77.61, 77.61, 77.61, 109.7, 109.7, 109.7, 194.5, 194.5, and 277.2 K, respectively; $\rho(293K)/\rho(20K)$ = 10.6.
6	29	C	1952	313, 373		695	Pure; 1.445 in. dia x 2.008 in. long; supplied by Sylvania Electric Products Corp; prepared by hot-pressing uranium powder; density 18.86 g cm^{-3}; Armco iron used as comparative material.
7	29	C	1952	313, 373		BMI	Pure; rolled from 1.625 in. to 0.875 in. in dia at 500 C, heat treated at 725 C for 0.5 hr, water quenched from 725 C, and α-phase annealed at 525 C for 1 hr; density 18.86 g cm^{-3}; Armco iron used as comparative material.
8	29	C	1952	313, 373		688	Pure; 1.449 in. dia x 1.98 in. long; supplied by Sylvania Electric Products Corp; powder-compact prepared by decomposition of UH_3 under hot pressing; grain size 0.25-0.50 mm in dia; density 18.84 g cm^{-3}; Armco iron used as comparative material.
9	29	C	1952	313, 373		690	Pure; 1.445 in. dia x 2.06 in. long; supplied by Sylvania Electric Products Corp; powder-compact specimen prepared by decomposition of UH_3 under hot pressing; fine grained; density 18.905 g cm^{-3}; Armco iron used as comparative material.
10	122	L	1955	2.5-94	±3.0		Highly pure; specimen 2.95 cm long and 0.203 cm in dia; supplied by Atomic Energy Research Establishment; electrical resistivity reported as 2.2, 2.4, 2.5, 2.7, 3.0, 4.2, 6.7, 9.4, and 11.1 μohm cm at 9.4, 13.5, 17.8, 20.6, 26.1, 35.1, 56.3, 79.5, and 90.0 K, respectively.
11	86	C	1945	407-534		U1	0.068 C, 0.004 Si, 0.0035 Fe, 0.002 Ni, 0.0009 N, 0.0002 Cr, 0.0002 Ag, and 0.00014 B; 1 in. dia x 10.75 in. long; extruded; thermal conductivity measured in the direction of extrusion; brass used as comparative material.
12	86	C	1945	340-711		U2	0.0720 C, 0.0150 Fe, 0.0100 Ag, 0.0028 N, 0.0020 Ni, 0.00175 Si, 0.0005 Cu, 0.0003 Cr, and 0.00012 B; 1 in. dia x 10.75 in. long; extruded; thermal conductivity measured in the direction of extrusion; brass used as comparative material.

SPECIFICATION TABLE NO. 64 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
13	33	E	1955	371-1105	±5.0		Pure; 0.86 cm dia x 14 cm long; density 18.6 g cm^{-3}; electrical resistivity reported as 39.6, 41.6, 41.8, 43.4, 43.9, 45.4, 46.3, 47.2, 48.8, 50.9, 51.2, 52.4, 54.1, 56.5, 56.1, 57.8, 58.2, 56.9, 57.8, 58.4, 57.9, 59.5, 59.3, 58.9, 57.7, 58.5, 56.0, 50.5, 50.4, 54.3, and 54.3 μohm cm at 97, 137, 137, 185, 188, 192, 234, 236, 277, 316, 323, 353, 366, 432, 440, 458, 463, 466, 475, 532, 532, 597, 623, 640, 645, 652, 696, 711, 720, 829, and 835 C, respectively; thermal conductivity data show no discontinuous change at the transition points, whereas the electrical resistivity data show sudden changes.
14	276	C	1953	343	3.0		Pure; specimen 0.1875 x 0.1875 x 1.75 in.; density 18.8 g cm^{-3}; Armco iron used as comparative material.
15	245	L	1945	304-339	2.0	C-241-7B	From an "as rolled" rod, heated 2 hrs at 850 C and water quenched.
16	394	C	1955	343.2	±3.0	1 B 2	0.03 C; supplied by Argonne National Laboratory; as-rolled; Armco iron used as comparative material.
17	394	C	1955	343.2	±3.0	2 B 3	0.08 C; supplied by Argonne National Laboratory; as-rolled; Armco iron used as comparative material.
18	394	C	1955	343.2	±3.0	A-6	High purity; supplied by Argonne National Laboratory; quenched from 1000 C; Armco iron used as comparative material.
19	394	C	1955	343.2	±3.0	A-8	High purity; supplied by Argonne National Laboratory; quenched from 900 C; Armco iron used as comparative material.
20	394	C	1955	343.2	±3.0	35	Supplied by Argonne National Laboratory; prepared from hot-pressed UH_3; Armco iron used as comparative material.
21	394	C	1955	343.2	±3.0	5 A 3	0.1 Cr; supplied by Argonne National Laboratory; as-rolled; Armco iron used as comparative material.
22	97	L	1952	2.1-21	2.0-3.0	U 1	Supplied by Atomic Energy Research Establishment.
23	414	L	1954	373-923	±2.0	U 1	Bar specimen; cast.
24	414	L	1954	373-923	±2.0	U 2	The above specimen heated to 690 C, maintained for several hrs in the β-phase then cooled to room temp at a rate of 4.2 C per min to change from β to α phase.
25	415	E	1953	311-548	±5.0		Cylindrical bar specimen; cast.
26	415	E	1953	323-458	±5.0		Cylindrical bar specimen; cast; irradiated to 190 M.W.D./Tonne at 300 C; "cooling time" >1 yr.
27	395	C	1958	293-1073	< ±5.0		Measured in vacuum; Zircaloy-2 was used as comparative material.
28	416	L	1949	293-473		Canadian extruded No. 1	0.026 Si, 0.0188 Fe, 0.0036 Ni, 0.0030 Mn, 0.001 Cu, 0.0009 Cr, 0.0001 Co, and 0.00005 Ag; specimen approx 2.5 cm in dia and 8.0 cm in length; taken from a bar of metal refined in Canada, extruded in the γ-phase at 800 C to 900 C by Bureau of Mines; heated at 250 C for an hr for tinning; measured in vacuum.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
29	416	L	1949	291-422		Canadian extruded No. 1	The above specimen measured in a hotter furnace with different temp gradient in guard sleeve.
30	416	L	1949	470-1003		Canadian extruded No. 1	The above specimen heated at 800 C for 0.5 hr before measurement.
31	416	L	1949	420, 667		Canadian extruded No. 1	The above specimen heated to 400 C three times before measurement.
32	416	L	1949	470, 572		Canadian extruded No. 1	The above specimen heated to 500 C; measured by a new main heater.
33	416	L	1949	573.9		Canadian extruded No. 1	The above specimen heated to 400 C for 40 min prior to measurement.
34	416	L	1949	574-872		Canadian extruded No. 1	The above specimen tempered for 6 hrs at 600 C during the measurement.
35	416	L	1949	304-878		Canadian extruded No. 1	The above specimen completely remounted and heated to 600 C to set bonds.
36	416	L	1949	477-877		Canadian extruded No. 1	The above specimen heated to 600 C for 3 hrs and cooled down before measurement.
37	416	L	1949	299-878		Canadian extruded No. 1	The above specimen heated for 1.5 hrs at 700 C.
38	416	L	1949	477-878		Canadian extruded No. 1	The above specimen heated for 2 hrs at 700 C.
39	416	L	1949	475-878		Canadian extruded No. 1	The above specimen heated for 2.5 hrs at 600 C.
40	417, 701	C	1943	323-573			Natural uranium; 1 in. in dia; extruded; measured along the direction of extrusion; brass used as comparative material (assumed thermal conductivity 0.23 cal sec^{-1} cm^{-1} C^{-1}).
41	413	L	1955	489-884			Cast uranium; specimen heated from α-phase to β-phase and cooled again to α-phase; electrical resistivity reported as 44.7, 46.2, 54.2, 56.3, and 58.1 μohm cm at 202, 296, 405, 509, and 599 C, respectively.
42	418	L	1942	333.2		Tuballoy	Sintered; density 14.79 g cm^{-3} at about 25 C; the sintered uranium specimen contained possibly some uranium carbide.
43	418	L	1942	333.2		Tuballoy	Sintered and cold-pressed with 200 tons; density 17.22 g cm^{-3} at about 25 C; the sintered uranium specimen contained possibly some uranium carbide.
44	418	L	1942	334.2		Tuballoy	Pure; sintered; density 16.29 g cm^{-3} at about 25 C.
45	418	L	1942	334.2		Tuballoy	Pure; sintered; density 15.72 g cm^{-3} at about 25 C.
46	418	L	1942	336.2		Tuballoy	Fused; density 18.06 g cm^{-3} at about 25 C.
47	418	L	1942	335.2		Tuballoy	Fused; density 18.52 g cm^{-3} at about 25 C.

SPECIFICATION TABLE NO. 61 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
48	420	C	1957	407-932	±7.0		Pure; measured in a vacuum of 10^{-6} mm Hg; Armco iron used as comparative material.
49	421	C	1961	423-1023		Casting No. 747	< 0.005 each of K, P, Ti and Zn, 0.002 Si, < 0.002 each of Ca and Mo, 0.001-0.002 C, < 0.001 each of As and Na, 0.0003-0.0005 Fe, < 0.0005 each of Al, Be, Co, Ni, and Sn, 0.0004 Sb, 0.0003 Mg, 0.0001 Cu, < 0.0001 each of Ag, Bi, Cr, Li, and Pb, and < 0.00001 B; specimen 2 cm in dia and 15 cm long; machined from cast ingot; Armco iron used as comparative material.
50	422		1945	398-573			Pure; γ-extruded; measured in argon.
51	396		1954	293-1173			Average values for two specimens measured.
52	604	R	1943	357-514			Hollow cylinder; extruded.
53	605	P	1955	323.2			Specimen in the shape of a sphere; cast by Westinghouse Co.; thermal conductivity value calculated from measured thermal diffusivity using the specific heat value of 0.026 cal g^{-1} C^{-1} and the density 18.6 g cm^{-3}.
54	605	C	1955	323.2	10.0		Specimen 2 in. in dia and 1.31 in. long; cast by Westinghouse Co.; cold rolled iron used as comparative material (reference value [illegible] 0.12 cal cm^{-1} sec^{-1} C^{-1}).
55	605	L, C	1955	323.2	10.0		Porous specimen 2.5 cm x 2 cm x 2.05 cm; prepared from sintered metal powder by Metal Hydrides Corp; copper used as comparative material (reference value 0.91 cal cm^{-1} sec^{-1} C^{-1}).
56	538	L	1956	293-973	5.0		Pure; measured in a vacuum of about 1 x 10^{-4} mm Hg.
57	606	L	1954	334-873			In α-phase; cast; electrical resistivity reported as 34.48, 38.62, 42.76, 46.90, 51.04, 55.18, 59.32, 61.39, and 56.74 μohm cm at 0, 100, 200, 300, 400, 500, 600, 650, and 690 C, respectively.
58	607	P	1954	323-1048			Specimen 0.125 in. in dia; Ames uranium; thermal conductivity values calculated from measured data of thermal diffusivity.
59	416	L	1956	285-776		Canadian extruded No. 2	0.026 Si, 0.0188 Fe, 0.0036 Ni, 0.0030 Mn, 0.0010 Cu, 0.0009 Cr, 0.0001 Co, and 0.00005 Ag; prepared from a bar of metal refined in Canada and extruded in the γ-phase at a temp between 800 and 900 C by Bureau of Mines; specimen approx 2.5 cm in dia and 8.0 cm in length; ends plated with Ni and Cu, tinned to the main heater and the heat sink at approx 250 C for 1 hr, then cooled to room temp; heated to 600 C and held for 45 min for bonding; measured in vacuum.
60	416	L	1956	471.2		Canadian extruded No. 2	The above specimen remounted and heated to 750 C for 15 min to set bonds.
61	416	L	1956	677-979		Canadian extruded No. 2	The above specimen heated to 700 C and cooled to room temp prior to the measurement; measured with decreasing temp.
62	416	L	1956	480-875		Canadian extruded No. 2	The above specimen heated to 300 C and cooled to room temp prior to the measurement.

SPECIFICATION TABLE NO. 64 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
63	416	L	1956	293-781		Chalk River No. 1	Specimen approx 2.5 cm in dia and 8.0 cm in length; ends-plated with Ni and Cu, tinned to the main heater and heat sink at approx 250 C for 1 hr, then cooled to room temp; measured in vacuum.
64	416	L	1956	432-687		Chalk River No. 2	Similar to above.
65	416	L	1956	497-738		Chalk River No. 2	The above specimen remounted.
66	416	L	1956	298-683		Chalk River No. 3	Similar to the above specimen.
67	416	L	1956	474-726		Chalk River No. 3	The above specimen remounted.
68	730	L	1945	301-333	2	C-241-7A	Pure; prepared from a rolled rod; heated 2 hrs at 850 C and water quenched.
69	730	L	1945	304-333	2	C-245-1	Pure; prepared from a rolled rod.
70	800	C	1966	422-819	5.0	13	Specimen 2.5 cm in dia and 17.7 cm long; Springfield uranium; β-quenched and α-annealed; Armco iron used as comparative material.
71	910	P	1953	337-588			Specimen 0.125 in. in dia and 30 cm long; swaged from a Hanford uranium slug and annealed; thermal conductivity values calculated from the measured data of thermal diffusivity using the density and specific heat data of Katz, J. J. and Rabinowitch, E. ("The Chemistry of Uranium", McGraw-Hill, pp. 144-8, 158).
72	910	P	1953	481-693			Another run of the above specimen.
73	911	C	1965	333.2			0.05-0.12 Al, 0.1 C, 0.02-0.05 Fe, 0.01 total of N, O and Si; Springfields standard adjusted uranium; specimen 2.9 cm in dia and 7.5 cm long; cast; heat treated by traverse water quenching in the beta phase (666-760 C) followed by an anneal for 1 hr at 550 C; Armco iron used as comparative material.
74	911	C	1965	333.2			Similar to the above specimen.
75	911	C	1965	333.2			Similar to the above specimen.
76	911	C	1965	333.2			Similar to the above specimen.
77	911	C	1965	333.2			Similar to the above specimen.
78	911	C	1965	333.2			Similar to the above specimen.
79	911	C	1965	333.2			Similar to the above specimen.
80	911	C	1965	333.2			Similar to the above specimen.
81	911	C	1965	333.2			Similar to the above specimen except annealed at 450 C for 3000 hrs.
82	911	C	1965	333.2			Similar to the above specimen.
83	911	C	1965	333.2			Similar to the above specimen.
84	911	C	1965	333.2			Similar to the above specimen except annealed at 450 C for 10000 hrs.

SPECIFICATION TABLE NO. 64 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
85	911	C	1965	333.2			Similar to the above specimen.
86	911	C	1965	333.2			Similar to the above specimen.
87	911	C	1965	333.2			Similar to the above specimen.
88	911	C	1965	333.2			0.05-0.12 Al, 0.1 C, 0.02-0.05 Fe, 0.01 total of N, O and Si; irradiated Springfields standard adjusted uranium; specimen 2.9 cm in dia and 7.5 cm long; cast; heat treated by traverse water quenching in the beta phase (666-760 C) followed by an anneal for 1 hr at 550 C; irradiated in the Calder Hall reactors at an estimated mean temp of 250 C with doses ranging from 1152 to 1932 MWD/te; Armco iron used as comparative material.
89	911	C	1965	333.2			Similar to the above specimens except irradiated at an estimated mean temp of 320 C with doses ranging from 3000 to 3298 MWD/te.
90	911	C	1965	333.2			Similar to the above specimen except irradiated at an estimated mean temp of 370 C with doses ranging from 659 to 1750 MWD/te.
91	911	C	1965	333.2			Similar to the above specimens except irradiated at an estimated mean temp of 395 to 415 C with doses ranging from 55 to 4660 MWD/te.
92	911	C	1965	333.2			Similar to the above specimens except irradiated at estimated mean temp 420 to 450 C with doses ranging from 985 to 3157 MWD/te.
93	843	-	1966	297.7			0.05 Fe, 0.01 Mg, 0.008 Mo, 0.005 Si, < 0.005 P, < 0.005 K, < 0.005 Ti, < 0.005 Zn, < 0.002 Ca, < 0.001 As, < 0.001 Na, 0.0005 Ni, < 0.0005 Al, < 0.0005 Co, < 0.0005 Sn, 0.0004 Mn, 0.0002 Cu, 0.0001 Pb, traces of Ag, Bi, Cr, Li, Sb, Be, and B; spherical powder obtained from National Lead Co.; contained in a 0.75 in. dia x 2 in. long stainless steel cylindrical cell; mesh size -16 + 20; grain size 1000 μ; thermal conductivity measured by the transient line source method; measured in nitrogen at atmospheric pressure.
94	843	-	1966	297-553			Same impurities, source, and measuring method as above; mesh size -70 + 80; grain size 190 μ; measured in nitrogen at atmospheric pressure.
95	843	-	1966	297-553			Same impurities, source, and measuring method as above; mesh size -230 + 325; grain size 50 μ; measured in nitrogen at atmospheric pressure.
96	843	-	1966	298.2			Same impurities, source, and measuring method as above; mesh size -16 + 20; average grain size 1000 μ; measured in nitrogen under pressures ranging from 2.85×10^{-5} to 8.71×10^{2} mm Hg.
97	843	-	1966	298.2			Same impurities, source, and measuring method as above; mesh size -40 + 50; average grain size 350 μ; measured in nitrogen under pressures ranging from 5.13×10^{-5} to 6.166×10^{3} mm Hg.
98	843	-	1966	298.2			Same impurities, source, and measuring method as above; mesh size -70 + 80; measured in nitrogen at 1 atm.
99	843	-	1966	298.2			Similar to above; measured in nitrogen under pressures ranging from 10^{-2} to 5.495×10^{3} mm Hg.

SPECIFICATION TABLE NO. 64 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
100	843	-	1966	298.2			Similar to above; measured in helium under pressures ranging from 10^{-2} to 3.589×10^3 mm Hg.
101	843	-	1966	298.2			Similar to above; measured in methane under pressures ranging from 10^{-2} to 3.715×10^3 mm Hg.
102	843	-	1966	298.2			Similar to above; measured in argon under pressures ranging from 10^{-2} to 5.370×10^3 mm Hg.
103	843	-	1966	298.2			Similar to above; measured in nitrogen under pressure ranging from 2.92×10^{-6} to 5.188×10^3 mm Hg.
104	843	-	1966	298.2			Same impurities, source, and measuring method as above; mesh size -170 + 200; average grain size 80 μ; measured in nitrogen under pressures ranging from 2.34×10^{-6} to 4.955×10^3 mm Hg.
105	843	-	1966	298.2			Same impurities, source, and measuring method as above; mesh size -230 + 325; average grain size 53 μ; measured in nitrogen under pressures ranging from 1.05×10^{-2} to 2.483×10^3 mm Hg.
106	843	-	1966	298.2			Same impurities, source, and measuring method as above; mesh size -230 + 325; measured in nitrogen at 1 atm.
107	843	-	1966	298.2			Similar to above; measured in nitrogen under pressures ranging from 0.01 to 3890 mm Hg.
108	912	C	1959	293-973			Specimen 0.5 in. in dia and 5.625 in. long; unirradiated, unclad national uranium; measured in a vacuum of 2×10^{-4} mm Hg; Armco iron used as comparative material; data reported here are ten times lower than the original data, which are believed to be wrong as the results of typographical error.
109	992	-	1966	354-1059			Total impurity content < 0.03; melted and cast in an alumina-coated graphite crucible; cooled and machined to desired dimensions; grain size ~0.25 mm; electrical resistivity reported as 33.8, 38.3, 44.3, 48.9, 53.8, 55.9, 57.5, 58.2, 56.0, 56.0, and 54.5 μohm cm at 81, 156, 234, 339, 440, 526, 570, 630, 682, 724, and 786 C respectively; Lorenz function reported as 2.17, 1.93, 2.82, 3.44, 3.51, 3.24, 3.37, and 3.30×10^{-8} V^2 K^{-2} at 96, 251, 467, 668, 670, 768, 773, and 801 C, respectively; thermal conductivity values originally used by the authors when deriving these Lorenz function values had been calculated from their measured data for specific heat and thermal diffusivity, present thermal conductivity values calculated (by TPRC) from reported electrical resistivity data and Lorenz function values.

DATA TABLE NO. 64 THERMAL CONDUCTIVITY OF URANIUM

REMARKS

The recommended values are for well-annealed high-purity uranium with residual electrical resistivity $\rho_0 = 2.2\ \mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 200 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated.

FIGURE SHOWS ONLY 22 OF THE CURVES REPORTED IN TABLE

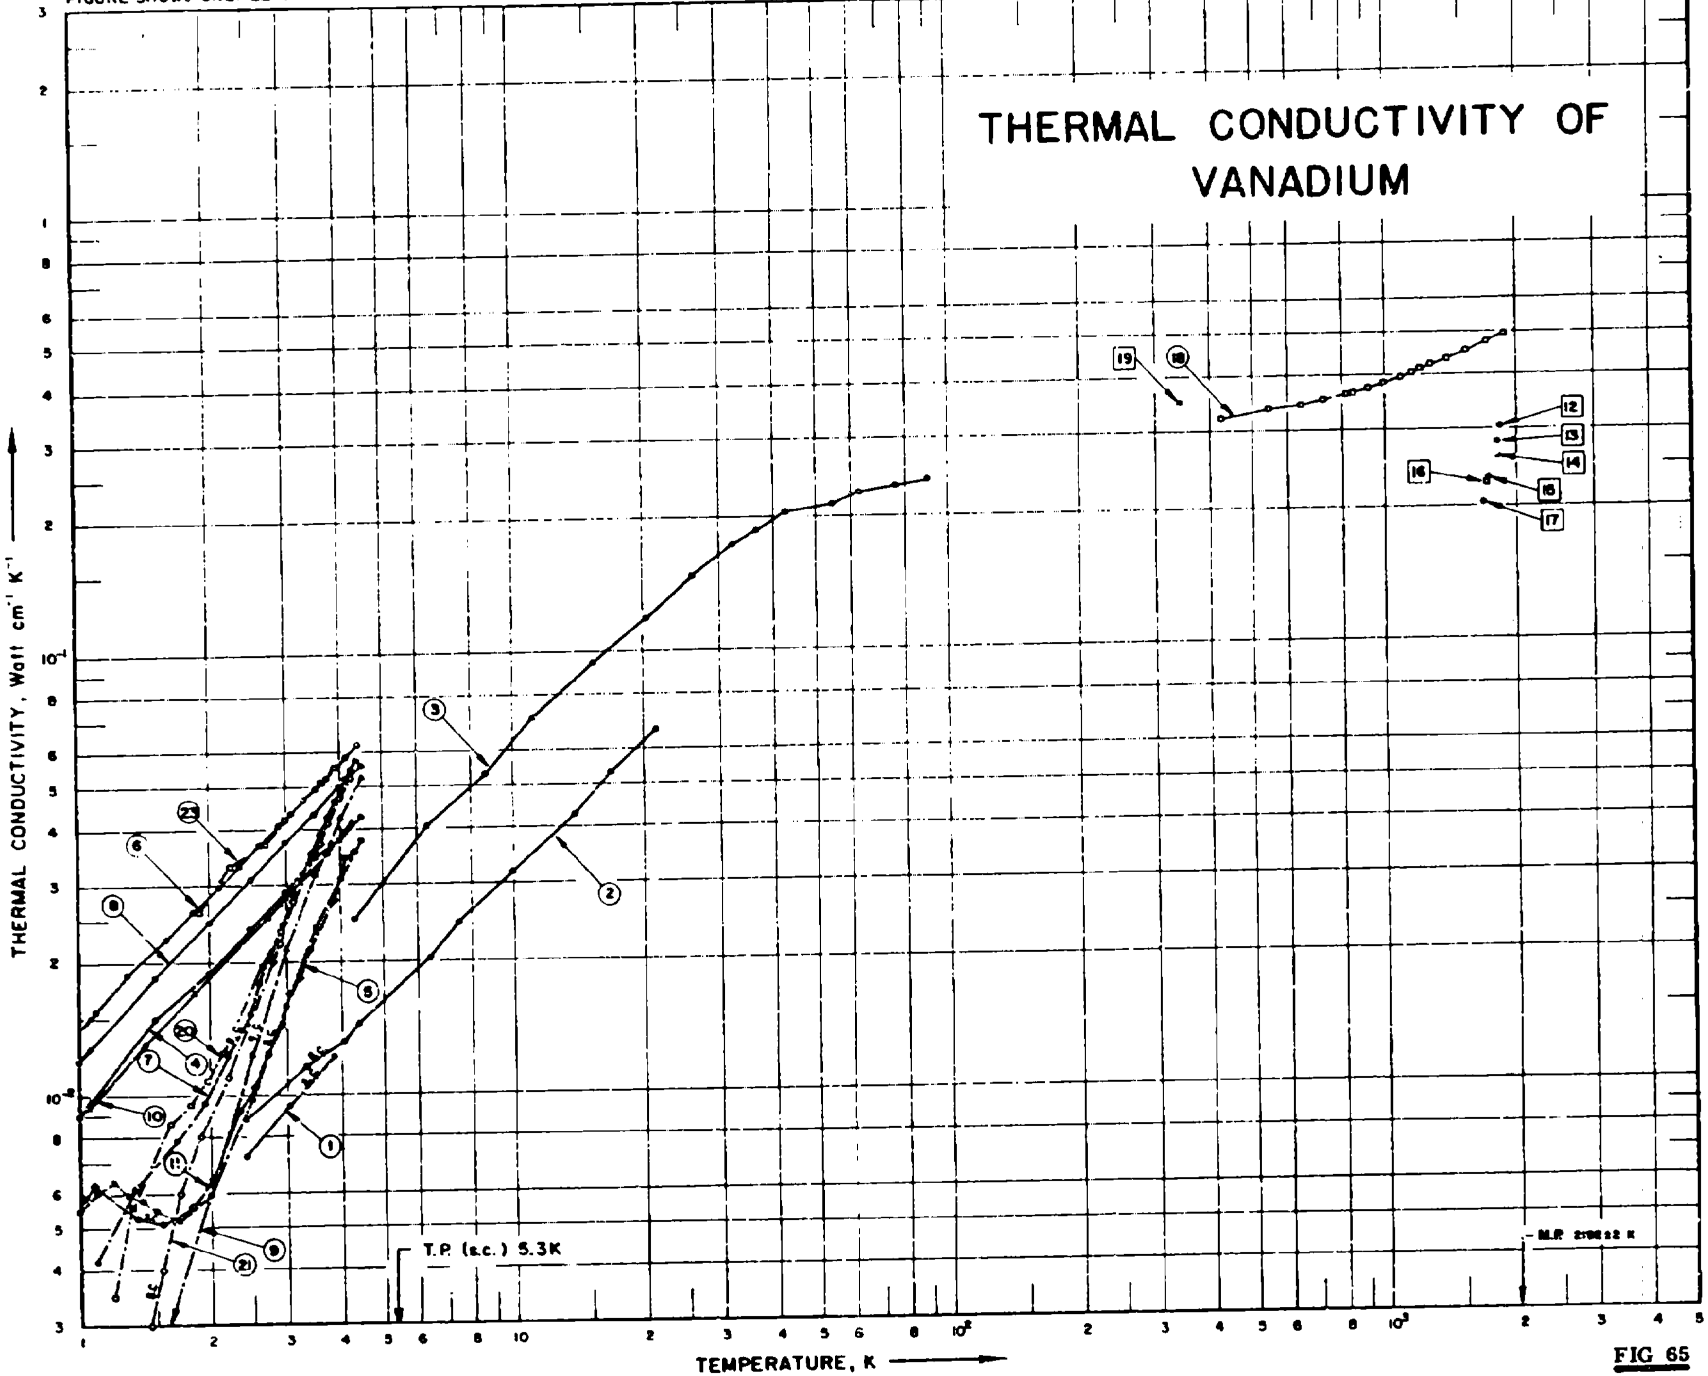

FIG 65

SPECIFICATION TABLE NO. 65 THERMAL CONDUCTIVITY OF VANADIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 65]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	122	L	1955	2.4-3.84	3	V 1	Polycrystalline; specimen 0.725 cm long, 0.0995 cm in dia; made from spectrographically standardized metal from Johnson, Matthey and Co.; in superconducting state.
2	122	L	1955	2.4-21		V 1	The above specimen measured in a magnetic field; in normal state.
3	151	L	1957	4.3-90		V 4	Approx. 99.9 pure; obtained from Electrometallurgical Co.; specimen 3.55 mm in dia; annealed in vacuo at 1300 C; residual electrical resistivity ρ_0 - 4.83 μohm cm; ideal electrical resistivity reported as 0.014, 0.036, 0.14, 0.38, 0.74, 2.3, 4.25, 8.7, 12.95, 16.65, 18.3, and 19.9 μohm cm at 15, 20, 30, 40, 50, 75, 100, 150, 200, 250, 273, and 295 K, respectively.
4	389	L	1958	0.5-4.5		V I	Single crystal; in normal state.
5	389	L	1958	1.0-4.5		V I	The above specimen in superconducting state.
6	389	L	1958	0.18-4.4		V II	Single crystal; in normal state.
7	389	L	1958	1.1-4.4		V II	The above specimen in superconducting state.
8	389	L	1958	0.2-4.5			Polycrystalline; in normal state.
9	389	L	1958	1.5-4.5			The above specimen in superconducting state.
10	501	L	1961	1.1-4.3		V II	0.05 Fe, 0.01 Si, 0.005 Mo, 0.0005 Mn, and 0.0003 Cu; single crystal; specimen obtained by floating-zone melting of polycrystalline rods; measured in magnetic field of 6200 oersteds; in normal state.
11	501	L	1961	0.92-4.3		V II	The above specimen measured with the magnetic field removed; in superconducting state.
12	601	-	1962	1840			Specimen 0.50 in. in dia and 0.442 in. thick; heated in high vacuum (10^{-5}mm Hg) by high frequency induction to 1000-3000 C; localized heating within 0.003 in. of the surface at current frequency of 500000 cps; heat lost only by radiation, cylindrical surface assumed isothermal, and the temperature gradient along the radius analytically correlated to the thermal conductivity, run No. 1.
13	601	-	1962	1807.5			The above specimen, run No. 3.
14	601	-	1962	1801.5			The above specimen, run No. 4.
15	601	-	1962	1729			The above specimen, run No. 6.
16	601	-	1962	1707.5			The above specimen, run No. 7.
17	601	-	1962	1674.5			The above specimen, run No. 8.
18	614	R	1961	423-1876	<5		99.74 V, 0.073 O, 0.048 Fe, 0.043 N, and 0.042 C; specimen composed of 5 one-inch dia disks; hot rolled and annealed; density 6.05 g cm^{-3}.

SPECIFICATION TABLE NO. 65 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
19	760	C	1955	343	±3		99.6⁺ pure, calcium reduced vanadium from the Electrometallurgical Co.; Armco iron used as comparative material.
20	677	L	1960	1.2-4.4			Single crystal; ~50 mm long, 4 mm in dia; prepared by 'floating zone' technique; in superconducting state.
21	677	L	1960	1.5-4.3			The above specimen irradiated to a dose of 10^{18} fast neutrons cm^{-2}; in superconducting state.
22	677	L	1960	1.4-3.2			The above specimen measured before irradiation; in normal state.
23	677	L	1960	1.9-4.4			The above specimen measured after irradiated to a dose of 10^{18} fast neutrons cm^{-2}; in normal state.

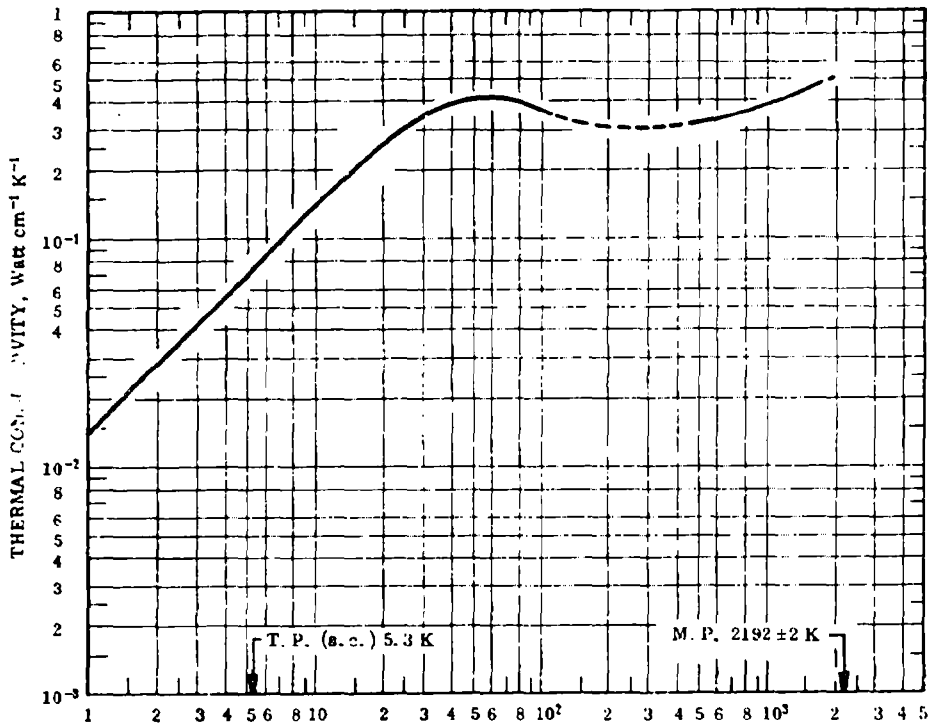
FIGURE AND TABLE NO. 65R RECOMMENDED THERMAL CONDUCTIVITY OF VANADIUM



REMARKS

The recommended values are for well-annealed high-purity vanadium with residual electrical resistivity ρ_0 = 1.72 $\mu\Omega$ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

REMARKS

The recommended values are for well-annealed 99.99⁺% pure yttrium with residual electrical resistivity ρ_0 = 5.10 $\mu\Omega$ cm (characterization by ρ_0 becomes important below room temperature). The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu lb^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or interpolated.

FIG 68

SPECIFICATION TABLE NO. 68 THERMAL CONDUCTIVITY OF ZINC

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 68]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	230	L	1925	323			99.97 pure; Baker's analyzed metal; cylindrical specimen 10 cm long, 1.9 cm in dia; electrical conductivity at 22 C being 17.0 x 10^4 ohm^{-1} cm^{-1}.
2	6	L	1931	409-640			Pure redistilled zinc; cylindrical specimen of 0.585 cm dia; fracture crystalline with crystals radiating from axis of rod; density 7.10 g cm^{-3} at 21 C; the same specimen used by Lees in 1908 (curve 6).
3	85	L	1919	402-851			Measured in both solid and liquid states.
4	511	L	1918	288.4			Specimen radius 0.685 cm; furnished by the manufacturer Erba.
5	127	L	1925	361-562			99.8 pure; obtained from London Zinc Mills; cast from billets, rolled at 200 C, sawed into strips and drawn cold; density 7.13 g cm^{-3} at 21 C; electrical resistivity reported as 6.08, 8.09, 10.48, and 14.50 μohm cm at 35, 105, 200, and 350.2 C, respectively.
6	88	L	1908	99-297			Pure; turned from a cast stick of "pure redistilled zinc"; fracture crystalline with crystals radiating from the axis of rod; cylinder about 7 cm long and 0.585 cm in dia; density 7.1 g cm^{-3} at 21 C; electrical resistivity reported as 1.699, 1.96, 3.26, 3.69, 4.32, 5.36, 6.30, 6.99, 7.14, and 8.01 μohm cm at -180.3, -168.4, -116.3, -99.7, -70.1, -24.7, 16.7, 47.8, 54.3, and 90.3 C, respectively; first experiment.
7	88	L	1908	104-300			Second experiment of the above specimen.
8	13, 14	F	1939	243-1003			Specimens 4-5 cm in dia, 20-25 cm long used to find data in the solid state; for the liquid state molten zinc contained in a graphite cylinder to form a specimen 25 cm long and 4 cm in dia.
9	16	F	1929	37-382			99.993 Zn, 0.005 Fe, and 0.0018 Cd; single crystal; obtained from the Bureau of Standards; melted in an evacuated glass tube, lowered from the furnace at the rate of 1 cm h^{-1}; heat flow parallel to the basal plane.
10	16	F	1929	98-434		No. 2	Same compositions and supplier as the above specimen; polycrystalline; cast in vacuo in a graphite mold.
11	16	F	1929	38-380		No. 1	Similar to above but cast in open air.
12	342	L	1953	2.5		Zn 2	99.997 pure; single crystal; 1-2 mm dia x 5 cm long; obtained from Imperial Smelting Corp; specimen axis at 80° with the hexagonal axis; measured in transverse magnetic fields with strength H ranging from 0.17 to 3.73 kilooersteds.
13	342	L	1953	4.6		Zn 2	The above specimen measured in transverse magnetic fields with strength H ranging from 0.17 to 3.73 kilooersteds.
14	342	L	1953	4.6		Zn 2	The above specimen measured in longitudinal magnetic fields with strength H ranging from 0.17 to 3.73 kilooersteds.
15	342	L	1953	2.5		Zn 4	Similar to the above specimen but rod axis at 13° with the hexagonal axis; measured in transverse magnetic fields with strength ranging from 0.36 to 3.59 kilooersteds.
16	342	L	1953	2.5		Zn 4	The above specimen measured in longitudinal magnetic fields with strength ranging from 0.36 to 3.50 kilooersteds.

SPECIFICATION TABLE NO. 68 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
17	342	L	1953	3.4		Zn 4	The above specimen measured in transverse magnetic fields with strength ranging from 0.36 to 3.59 kilooersteds.
18	342	L	1953	3.4		Zn 4	The above specimen measured in longitudinal magnetic fields with strength ranging from 0.36 to 3.75 kilooersteds.
19	342	L	1953	4.5		Zn 4	The above specimen measured in transverse magnetic fields with strength ranging from 0.36 to 3.90 kilooersteds.
20	342	L	1953	4.5		Zn 4	The above specimen measured in longitudinal magnetic fields with strength ranging from 0.36 to 3.85 kilooersteds.
21	97	L	1952	3.0-23	2-3	Zn 1	99.9995 pure; polycrystalline; 1-2 mm dia x 5 cm long; provided by Hilger H. S. brand (HS 8392); annealed in evacuated quartz tube for several hrs at two-thirds the melting point.
22	97	L	1952	1.8-41	2-3	Zn 2	99.997 pure; single crystal; 1-2 mm dia x 5 cm long; provided by Imperial Smelting Corp; hexagonal axis at 80° to the specimen axis; annealed as the above specimen.
23	97	L	1952	3.0-40	2-3	Zn 3	Similar to the above specimen but hexagonal axis at 13° to the specimen axis.
24	280	L	1934	330.2	<0.8		99.99$^+$ Zn, 0.0047 Pb, 0.0008 Cd, 0.0004 Fe, and 0.0002 Cu; unstrained single crystals; grown from a single 50 lb slab of "Evanwall" zinc; specimens 30 cm long, area of cross section 1.24 cm; measured on specimens having various orientations with values of $\cos^2\theta$ ranging from zero to 0.990 where θ is the angle between the normal to the basal cleavage plane and the axis of the rod.
25	280	L	1934	330.2	<0.8		Some of the above specimens strained by bending and straightening in both directions of the midpoint; measured with $\cos^2\theta$ ranging from zero to 0.51.
26	280	L	1934	330.2	<0.8		The above specimens annealed at 380 C for 11 hrs.
27	280	L	1934	330.2	<0.8		"Optically mosaic" crystals; two of the specimens grown from the same allotment of zinc as the above specimens; the other two ($\cos^2\theta$ = 0.93 and 0.935, respectively) grown from a different lot under different conditions; measured on the four specimens with $\cos^2\theta$ ranging from 0.13 to 0.935.
28	280	L	1934	330.2	<0.8		The second one of the above specimens strained by bending and straightening.
29	280	L	1934	330.2	<0.8		The first specimen ($\cos^2\theta$ = 0.13) and the above specimen annealed.
30	279	R	1951	331.4			Powdered; apparent density 2.454 g cm^{-3}.
31	279	R	1951	330.8			Powdered; apparent density 2.443 g cm^{-3}.
32	279	R	1951	331.0			Powdered; apparent density 2.465 g cm^{-3}.
33	279	R	1951	331.1			Powdered; apparent density 2.456 g cm^{-3}.
34	122	L	1955	2.7-21	3	Zn 4	99.997 pure; single crystal with hexagonal axis at 13° to rod axis; obtained from Imperial Smelting Corp; 2.75 cm x 0.0234 cm^2.

SPECIFICATION TABLE NO. 68 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
35	431	E	1944	394-550			Single crystal; electrical resistivity reported as 8.32, 8.88, 9.59, 10.10, 10.85, 11.53, and 12.66 μohm cm at 121.1, 143.9, 169.6, 188.4, 213.8, 238.9, and 277.1 C, respectively.
36	431	E	1944	371-529			Polycrystal; electrical resistivity reported as 8.22, 8.65, 9.09, 9.45, 10.19, 11.04, 11.85, 12.70, and 13.19 μohm cm at 97.9, 111.2, 123.9, 137.6, 159.4, 186.4, 213.6, 247.1, and 255.8 C, respectively.
37	504	P	1961	295.2	± 5		Pure; specimen size 1.9 x 1.16 x 0.282 cm; thermal conductivity value calculated from measured thermal diffusivity using data of specific heat and density taken from Smithsonian Physical Tables (9th ed., 1954).
38	409	L	1958	0.14-0.87	10	Zn 1	0.0001 impurity; single crystal; ~1.5 mm in dia and 100 mm long; specimen axis at an angle of 30 degrees to the [001] direction; measured in a magnetic field of 0.2 oersted; in superconducting state.
39	409	L	1958	0.18-0.91	10	Zn 1	The above specimen measured in a longitudinal magnetic field of 60 oersteds; in normal state.
40	409	L	1958	0.22-1.3	10	Zn 2	Similar to the above specimen but measured in a magnetic field of 0.2 oersted; in superconducting state.
41	294	L	1932	22-293		Zn 61	Single crystal; specimen 5.27 cm long, area of cross section 0.0552 cm^2; angle between specimen axis and hexagonal axis $\theta = 3.6°$; electrical resistivity reported as 0.0674, 1.331, 5.69, and 6.16 μohm cm at -252, -190, 0, and 20 C, respectively.
42	294	L	1932	21-92		Zn 100	Single crystal; $\theta = 4.9°$; electrical resistivity reported as 0.056, 1.333, 5.72, and 6.20 μohm cm at -252, -190, 0, and 20 C, respectively.
43	294	L	1932	21-293		Zn 72	Single crystal; specimen 6.13 cm long, area of cross section 0.0634 cm^2; $\theta = 8.7°$; electrical resistivity reported as 0.0522, 1.3, 5.58, and 6.05 μohm cm at -252, -190, 0, and 20 C, respectively.
44	294	L	1932	21-296		Zn 101	Single crystal; specimen 4.94 cm long, area of cross section 0.0623 cm^2; $\theta = 79.7°$; electrical resistivity reported as 0.0524, 1.179, 5.43, and 5.88 μohm cm at -252, -190, 0, and 20 C, respectively.
45	727, 291	L	1960	0.10-0.94		Zn 4	Single crystal; grown along the principal crystallographic direction by Kapitza's method; superconducting transition point 0.825 K; heat flow parallel to the hexagonal axis; in superconducting state.
46	727, 291	L	1960	0.10-1.09		Zn 7	Similar to above but heat flow perpendicular to the hexagonal axis; in superconducting state.
47	727, 291	L	1960	0.825		Zn 1	Similar to above.
48	727, 291	L	1960	0.825		Zn 2	Similar to above.
49	727, 291	L	1960	0.825		Zn 5	Similar to above but heat flow parallel to the hexagonal axis.

SPECIFICATION TABLE NO. 68 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
50	129	C	1933	462-553	5	Z. S.	99.9^{+} Zn, 0.04 Pb, and 0.02 Fe; 2 cm dia x 15 cm long; specimen prepared by remelting commercially pure zinc and casting in graphite mold; lead used as comparative material (reference value taken from International Critical Table Vol. II: 0.352 Watt cm^{-1} C^{-1} at 0 C).
51	129	C	1933	313-596	5	Z. S.	Similar to the above specimen except commercial malleable nickel used as the indirect comparative material (based on the data of lead).
52	129	C	1933	342-602	5	Z. S.	Similar to that of the above specimen except zinc used as the indirect comparative material (based on the data of lead).
53	77	L	1900	291, 373		Zinc II	99.97 Zn (by difference), 0.01 Cd, 0.01 Fe, and 0.01 Pb; specimen 27 cm long and 1.805 cm in dia; density [illegible].11 g cm^{-3}; electrical conductivity reported as 16.51 and 12.59 x 10^4 ohm^{-1} cm^{-1} at 18 and 100 C, respectively.
54	77	L	1900	291, 373		Zinc II, wire	Similar to the above specimen but electrical conductivity reported as 15.98 and 12.42 x 10^4 ohm^{-1} cm^{-1} at 18 and 100 C, respectively.
55	734	R	1926	323, 673			Specimen in the form of a hollow cylinder.
56	838	C	1966	576-874			Molten specimen placed in a hole 21 mm in dia drilled in an asbestos cement cylinder of 30 mm height; 1Kh18N9T steel used as comparative material.
57	850	L	1929	83-476			Prepared by melting pure zinc supplied by Firma Kahlbaum in a quartz tube, then quickly solidified in cool water; electrical resistivity reported as 1.658, 5.663, 7.837, and 10.36 μohm cm at 83.2, 273, 374, and 476 K, respectively.

REMARKS

The recommended values are for well-annealed 99.999⁺% pure zinc with residual electrical resistivity ρ_0 = 0.00128 μΩ cm (characterization by ρ_0 becomes important at temperatures below about 150 K). The values below 1.5 T_m are calculated to fit experimental data by using n = 3.00, α' = 1.83 x 10^{-4}, and β = 0.0525. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 3% of the true values near room temperature and 3 to 10% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated.

FIG 69

SPECIFICATION TABLE NO. 69 THERMAL CONDUCTIVITY OF ZIRCONIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 69]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	83	L	1956	2.2-91		Zr 1a	99.99 Zr; spectroanalysis shows Fe (all sensitive lines), Hf and Ni (all sensitive lines faintly), Si and Ti (some sensitive lines), and Al, Cr, Cu, and Mg (faintly visible); JM5000 from Johnson, Matthey and Co.; 3 mm dia rod annealed at 950 C for 5 hrs in vacuum; electrical resistivity 48 μohm cm at 293 K, residual electrical resistivity 1.98 μohm cm; mounted in the cryostat with a push fit into copper fitting; measured with the current lead (for the measurements of electrical resistivity) attached.
2	83	L	1956	3.3-90		Zr 1b	The above specimen measured with the current lead removed.
3	83	L	1956	14-90		Zr 1c	The above specimen unintentionally strained by drilling and tapping to insert the connectors for re-mounting.
4	292	P	1954	298, 873			Preliminary results.
5	27	C	1953	323-673		2682 A	Pure; 2 cm dia x 15 cm long; arc-melted from WAPD grade 1 crystal bar; Armco iron used as comparative material; data taken from smoothed curve.
6	27	C	1953	323-673		498	Pure; 2 cm dia x 15 cm long; arc-melted from Bureau of Mines sponge Zr; Armco iron used as comparative material; data taken from smoothed curve.
7	101	L	1955	336-950	2.0		Nominally pure; cylindrical specimen 7.938 in long, 0.787 in. in dia; obtained from Westinghouse; prepared from Foote Grade 1 crystal bar ingot; the ingot melted in tungsten arc furnace, forged at 845 C in argon to the size 10 x 1 x 1 in., annealed in vacuum for 0.5 hr at 1000 C; machined to final shape.
8	555	C	1956	373.2			Hafnium-containing crystal bar.
9	614	R	1961	484-1925	5		99.95 Zr, 0.029 Fe, 0.017 C, 0.0045 Hf, and <0.031 other elements; specimen consisted of 5 one-in. dia disks; density 6.49 g cm^{-3}.
10	194	L	1951	402-639	±5.0	D-151	Assumed to be pure; 0.626 in. dia crystal bar; lot No. D-151; obtained from Argonne National Laboratory.
11	441		1957	331-917		Iodide Zirconium	99.9 pure; annealed in vacuum for 8 hrs at 700 C; electrical resistivity at 58.0, 124.1, 239.8, 321.0, 415.6, 490.6, 558.8, and 644.0 C being respectively, 36.1, 47.6, 66.6, 75.8, 87.0, 94.4, 100.0, and 106 μohm cm; Lorenz number reported at these temperatures were 3.38, 3.33, 3.18, 3.11, 3.08, 3.04, 3.03, and 2.92 x 10^{-8} V^2K^{-2}, respectively.
12	441		1957	332-879			99.78 Zr, 0.14 Hf, and 0.08 C; electrical resistivity reported as 53.76, 64.93, 78.74, 87.71, 95.25, 105.26, 111.11, 120.48, and 125.00 μohm cm at 59.0, 117.0, 202.0, 262.0, 318.0, 402.0, 456.0, 548.0, and 606.0 C, respectively; Lorenz numbers reported at these temperatures were 3.46, 3.44, 3.54, 3.36, 3.37, 3.34, 3.37, 3.28 and 3.29 x 10^{-8} V^2K^{-2}, respectively.

SPECIFICATION TABLE NO. 69 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
13	295	L,R,C	1952	473-823			Pure; 98-100% of theoretical density.
14	401	L	1959	2.0-121		Zr 4	99.95 Zr, 0.0132 Hf, < 0.0100 each of P and Zn, 0.0079 C, 0.0021-0.0050 O, 0.0003-0.0050 N, 0.0024 Fe, 0.0011 Ni, 0.0002-0.0007 each of Ca, Cr, H, Mo, and Si, and < 0.0010 other elements; arc cast, annealed at 1100 C for 4 hrs, swaged at room temperature, annealed at 1000 C for 15 min and at 800 C in a vacuum of $1\text{-}2 \times 10^{-6}$ mm Hg for 15 min, cut to four lengths and clamped together.
15	401	L	1959	4.4-89		Zr 4a	The above specimen unclamped and retightened.
16	442	C	1951	323-573	± 3.0	Zr 1	0.04 Hf, 0.04 Fe, 0.02 Ni, 0.007 Ti, 0.001 Al, and 0.001 Sn; Westinghouse ingot D-216 forged at 950 C, and machined; electrical resistivity reported as 44.1 and 81.3 μohm cm at 298 and 533 K, respectively.
17	442	C	1951	323-573	± 3.0	SA 1568; Zr 7	0.1 Fe, 0.07 Ta, 0.07 C, 0.02 Al, 0.007 Ti, and 0.0055 N; obtained from ANL; annealed; electrical resistivity reported as 50.5, 68.2, and 85.1 μohm cm at 298, 415, and 533 K, respectively.
18	442	C	1951	323-573	± 3.0	SA 1576; Zr 8	0.16 Ta, 0.10 Fe, 0.06 Al, 0.02 C, 0.015 N, and 0.005 Ti; obtained from ANL; electrical resistivity reported as 52.4, 70.1, and 86.6 μohm cm at 298, 415, and 533 K, respectively.
19	715	L, C	1961	323, 423	± 5	050	99.827 Zr (by difference), 0.110, 0.045 Fe, 0.01 C, and 0.008 N; as-extruded rod 10 cm long, 1.27 cm in dia; arc-melted; electrical resistivity reported as 59.5 and 75 μohm cm at 323 and 423 K, respectively; Armco iron used as comparative material; energy flow also measured calorimetrically.
20	741	L	1965	1160-2000		Iodide Zirconium	99.5^{+} pure; 14 mm dia x 65 mm long; vacuum annealed; density 6.45 g cm^{-3} at room temperature.
21	843	-	1966	298.2			Powder specimen contained in a 0.75 in. dia x 2 in. long cylindrical cell; average grain size 36.9μ; thermal conductivity measured by using the transient line source method, measured in nitrogen at limiting high pressure.
22	843	-	1966	298.2			Similar to above except average grain size 48.0μ.
23	843	-	1966	298.2			Similar to above except average grain size 57.5μ.
24	843	-	1966	298.2			Similar to above except average grain size 67.8μ.
25	843	-	1966	298.2			Similar to above except average grain size 84.5μ.
26	843	-	1966	298.2			Similar to above except average grain size 95.3μ.
27	843	-	1966	298.2			Similar to above except average grain size 137μ.
28	843	-	1966	298.2			Similar to above except average grain size 164μ.
29	843	-	1966	298.2			Similar to above except average grain size 199μ.

SPECIFICATION TABLE NO. 69 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
30	843	-	1966	298.2			Similar to above except average grain size 228μ.
31	843	-	1966	298.2			Similar to above except average grain size 318u.
32	843	-	1966	298.2			Similar to above; mesh size-70 + 80; measured in nitrogen at 1 atm.
33	843	-	1966	298.2			Similar to above; mesh size -70 +80; measured in nitrogen under pressure in the range $1.06 \times 10^{-2} \sim$ [illegible]$.89 \times 10^{3}$ mm Hg.
34	843	-	1966	298.2			Similar to above; measured in helium under pressure in the range $1.00 \times 10^{-2} \sim 3.467 \times 10^{3}$ mm Hg.
35	843	-	1966	298.2			Similar to above; measured in argon under pressure in the range $1.00 \times 10^{-2} \sim 4.786 \times 10^{3}$ mm Hg.

REMARKS

The recommended values are for well-annealed 99.95⁺% pure zirconium with residual electrical resistivity ρ_0 = 0.219 μΩ cm (characterization by ρ_0 becomes important below room temperature). The values below 1.5 T_m are calculated to fit the experimental data by using n = 2.2, α' = 7.45 x 10^{-4}, and β = 8.98. The recommended values that are supported by experimental thermal conductivity data are thought to be accurate to within 5% of the true values near room temperature and 5 to 15% at other temperatures.

* T_1 in K, k_1 in Watt cm^{-1} K^{-1}, T_2 in F, and k_2 in Btu hr^{-1} ft^{-1} F^{-1}.

‡ Values in parentheses are extrapolated or interpolated.

1	55	+L	1928	353-473		No. 655	86.0	14.0	Approx. composition; specimen 2.53 cm in diameter and 38 cm long; cast; electrical resistivity reported at 353, 423, 473, 523, 573, and 623 K respectively as 5.24, 6.25, 6.97, 7.69, 8.40 and 9.14 μ ohm cm.
2	55	+L	1928	353-473		No. 671	88.0	12.0	Specimen 2.53 cm in diameter and 38 cm long; cast; electrical resistivity reported at 353, 423, 473, 523, 573, and 623 K respectively as 5.20, 5.96, 6.51, 7.03, 7.57 and 8.11 μ ohm cm.
3	55	+L	1928	353-473		No. 921	~88.0	~12.0	Trace Fe; specimen 2.53 cm in diameter and 38 cm long; cast; electrical resistivity reported at 353, 423, 473, 523, 573, 623 K respectively as 4.64, 5.61, 6.34, 7.12, 7.95, 8.82 μ ohm cm.
4	55	+L	1928	353-573		No. 2313	92.0	8.0	Specimen 2.53 cm in diameter and 38 cm long; cast; electrical resistivity reported at 353, 423, 473, 523, 573 and 623 K respectively as 4.06, 4.77, 5.40, 6.16, 7.03 and 8.08 μ ohm cm.
5	55	+L	1928	353-573		No. 2312	95.5	4.5	Specimen 2.53 cm in diameter and 38 cm long; cast; electrical resistivity reported at 353, 423, 473, 523, 573 and 623 K respectively as 4.04, 4.96, 5.61, 6.26, 6.92 and 7.58 μ ohm cm.
6	93	L	1931	87-476	3-4		92.0	8.0	Approx. composition; cast; electrical conductivity reported at 87, 273, 373 and 476 K respectively as 65.1, 29.3, 20.2 and 14.6×10^4 ohm^{-1} cm^{-1}.
7	93	L	1931	87-476	3-4		92.0	8.0	Approx. composition; cast; electrical conductivity reported at 87, 273, 373 and 476 K respectively as 65.1, 29.3, 20.2, and 14.6×10^4 ohm^{-1} cm^{-1}.
8	93	L	1931	87-476	3-4		85.0	15.0	Approx. composition; cast; electrical conductivity reported at 87, 273, 373 and 476 K respectively as 59.6, 22.2, 16.0 and 14.2×10^4 ohm^{-1} cm^{-1}.
9	53	E	1927	353-423	1.0		96.0	4.0	Approx. composition; cast.
10	53	E	1927	373.2			88.0	12.0	Approx. composition; cast; density 2.95 g cm^{-3}; electrical conductivity 0.16×10^6 ohm^{-1} cm^{-1} at 100 C.
11	25		1921	301, 346			~92.0	~8.0	Trace Si.
12	230	L	1925	326.2			90.0	10.0	Approx. composition, total impurity < 0.03 in each metal; prepared by fusing; specimen 1.9 cm in diameter and 10 cm long; supplied by Baker; electrical conductivity 26.0×10^4 ohm^{-1} cm^{-1} at 23 C.
13	230	L	1925	326.2			80.0	20.0	Similar to the above specimen except electrical conductivity, 20.9×10^4 ohm^{-1} cm^{-1} at 23 C.

SPECIFICATION TABLE NO. 71 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Al	Cu	Composition (continued), Specifications and Remarks
14	230	L	1925	326.2			70.0	30.0	Similar to above except electrical conductivity 18.5 x 10^4 ohm^{-1} cm^{-1} at 23 C.
15	230	L	1925	326.2			50.0	50.0	Similar to above except electrical conductivity 15.3 x 10^4 ohm^{-1} cm^{-1} at 23 C
16	36	R	1935	81.273	1.0		96.0	4.0	Approx. composition; cast sheet; annealed at 510 C for 45 min. and quenched in ice water.
17	826		1934	293.473			88.0	12.0	Density 3.0 g cm^{-3}; Brinell hardness number 80.
18	98	L	1922	373-573		V 671 A	88.0	12.0	Approx. composition; specimen 15 in. long and 1 in. in diameter; supplied by Metallurgical Dept. of National Physical Laboratory (England); chill cast.
19	98	L	1922	373-573		V 671 D	88.0	12.0	Approx. composition; commercially pure aluminum. specimen 15 ins. long and 1 in. in diameter; supplied by Metallurgical Dept. of National Physical Lab.; annealed at 450 C.
20	98	L	1922	373-573		V 671 C	88.0	12.0	Similar to above specimen except sand cast.

SPECIFICATION TABLE NO. 72 THERMAL CONDUCTIVITY OF [ALUMINUM + IRON] ALLOYS

(Al + Fe > 99.50%; impurity < 0.20% each)

[For Data Reported in Figure and Table No. 72]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Al	Fe	Composition (continued), Specifications and Remarks
1	225	L	1928	373-623			99.57	0.24	0.19 Si, trace Cu; specimen 12 in. long and 1 in. in diameter; annealed at 530 C for 5 hrs. before machining.
2	408	E	1925	302.2	< 0.5	AL	99.354	0.509	0.137 Si; specimen 5 mm thick and 29 cm long; chill-cast; specific gravity 2.70; specific resistance 0.354×10^{-5} ohm cm^{-3}.
3	408	E	1925	299.2	< 0.5	AL	99.354	0.509	0.137 Si; the above specimen annealed at 450 C for 30 min.; specific resistance 0.331×10^{-5} ohm cm^{-3}.
4	408	E	1925	301.2	< 0.5	AL	99.354	0.509	0.137 Si; specimen about 3 mm thick and 20 cm long; forged and cold-drawn; specific resistance 0.316×10^{-5} ohm cm^{-3}.
5	408	E	1925	304.2	< 0.5	AL	99.354	0.509	0.137 Si; the above specimen annealed at 500 C for 30 min.; specific resistance 0.313×10^{-5} ohm cm^{-3}.
6	30	L	1925	364-609	< 2.0		99.5	0.43	0.07 Si, trace Cu; commercially pure Al; specimen 15.5 in. long and 0.75 in. in diameter; cast.
7	17	L	1958	293-353	± 1.0	DIN 712	99.5	~0.32	0.019 Cu, 0.034 Zn, 0.019 Mg, 0.021 Mn, 0.012 Ti, 0.16 Si commercial pure aluminum; density 2.703 g cm^{-3} at 20 C.
8	15	F	1947	298-863	1.0-5.0	AL-2	99.20	0.67	0.10 Si, 0.01 Cu, <0.01 Mn and Mg; specimen 25 cm long and 2.5 cm in diameter.
9	410	R	1935	273.2	1.0	AL-2	99.66	0.2	0.14 Si.
10	54	L	1927	350-437			99.6	0.2	0.2 Si, single crystal; specimen 2.54 cm in diameter and 38 cm long, supplied by National Physical Lab.; specific resistivity 2.89×10^{-6} ohm cm^{-1} at 18 C.
11	98	L	1922	373-673		1	99.48	0.38	0.14 Si, trace Cu supplied by National Physical Lab.; chill-cast.
12	98	L	1922	373-673		2	99.48	0.38	0.14 Si, trace Cu; supplied by National Physical Lab.; chill-cast.
13	98	L	1922	373-623		1	99.48	0.38	0.14 Si, trace Cu; supplied by National Physical Lab.; sand-cast.
14	98	L	1922	373-623		2	99.48	0.38	0.14 Si, trace Cu; supplied by National Physical Lab.; sand-cast.
15	827	L	1958	298.2			92.4	7.6	Produced by powder metallurgical process; extruded rod 3/4 in. in diameter; heated at 800 F for 100 hrs.; density 2.88 g cm^{-3}.

SPECIFICATION TABLE NO. 87 THERMAL CONDUCTIVITY OF (BISMUTH + CADMIUM) ALLOYS

(Bi + Cd ≥ 99.50%, impurity ≤ 0.20% each)

[For Data Reported in Figure and Table No. 87]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Bi	Cd	Composition (continued), Specifications and Remarks
1	230	L	1925	328			50	50	Approximate composition, prepared from Bi (0.03 impurity supplied by Baker) and Cd (no details reported); specimen cast and machined to 10 cm long, 1.9 cm dia.; electrical conductivity 3.51 x 10^4 ohm^{-1} cm^{-1} at 22 C.
2	230	L	1925	328			60	40	Similar to the above specimen except electrical conductivity 2.35 x 10^4 ohm^{-1} cm^{-1} at 22 C.
3	230	L	1925	328			70	30	Similar to the above specimen except electrical conductivity 2.13 x 10^4 ohm^{-1} cm^{-1} at 22 C.
4	230	L	1925	328			80	20	Similar to the above specimen except electrical conductivity 1.75 x 10^4 ohm^{-1} cm^{-1} at 22 C.
5	230	L	1925	328			90	10	Similar to the above specimen except electrical conductivity 1.36 x 10^4 ohm^{-1} cm^{-1} at 22 C.
6	383		1956	307-498			99.6	0.4	Electrical conductivity ranging from 0.891 to 0.438 x 10^4 ohm^{-1} cm^{-1} at [illegible].7 to 224.8 C respectively.
7	383		1956	310-397			63.2	36.8	Electrical conductivity ranging from 3.49 to 2.685 x 10^4 ohm^{-1} cm^{-1} at 36.4 to 123.9 C respectively.
8	383		1956	324-506			99.1	0.9	Electrical conductivity ranging from 0.844 to 0.458 x 10^4 ohm^{-1} cm^{-1} at 50.6 to 232.9 C respectively.
9	383		1956	321-476			95.4	4.6	Electrical conductivity ranging from 1.010 to 0.511 x 10^4 ohm^{-1} cm^{-1} at 47.8 to 202.3 C respectively.
10	383		1956	309-394			90.0	10.0	Electrical conductivity ranging from 1.229 to 0.937 x 10^4 ohm^{-1} cm^{-1} at 36.1 to 121.0 C respectively.
11	383		1956	310-387			85.3	14.7	Electrical conductivity ranging from 1.61 to 1.25 x 10^4 ohm^{-1} cm^{-1} at 37.0 to 114.2 C respectively.
12	383		1956	300-397			80.7	19.3	Electrical conductivity ranging from 1.96 to 1.54 x 10^4 ohm^{-1} cm^{-1} at 32.5 to 232.6 C respectively.

FIG. 88

SPECIFICATION TABLE NO. 88 THERMAL CONDUCTIVITY OF (BISMUTH + LEAD) ALLOYS

(Bi + Pb > 99.50%; impurity < 0.20% each)

[For Data Reported in Figure and Table No. 88]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Bi	Pb	Composition (continued), Specifications and Remarks
1	126, 324	F	1955	293-373	< 7	6 B	99.15	0.85	Specimen composed of a few large crystals, prepared by fusing granular Pb and Bi in a N_2 atmosphere, casting in Pyrex tubing, and slowly cooling; electrical conductivity ranging from 4370 to 4450 $ohm^{-1} cm^{-1}$ at 293.2 to 373.2 K respectively.
2	126, 324	F	1955	293-373	< 8	8 B	98.5	1.5	Similar to the above specimen except electrical conductivity ranging from 3420 to 3666 $ohm^{-1} cm^{-1}$ at 293.2 to 373.2 K respectively.
3	126, 324	F	1955	293-373	< 6	3	97.0	3.0	Similar to the above specimen except electrical conductivity ranging from 2830 to 3040 $ohm^{-1} cm^{-1}$ at 293.2 to 373.2 K respectively.
4	113	C	1957	423-773		Bi-Pb eutectic	55.5	44.5	Eutectic composition, prepared from Pb of 99.995% purity and Bi of high purity; molten state; contained in a cavity 3.5 in. deep and 0.97 in. in dia.; stainless steel used as standard and as container; electrical resistivity ranging from 113.5 to 126.6 μ ohm cm at 150 to 500 C respectively.
5	19	L	1923	315-558		Bi-Pb eutectic	54.0	46.0	Eutectic alloy, specimen 1.5 cm dia., 12 cm long, melting point 403 K.
6	248	E	1956	295-443	±3		99.0	1.0	
7	248	E	1956	308-466	±3		98.5	1.5	Annealed for 48 hr. at 120 C.
8	248	E	1956	303-446	±3		98.0	2.0	Annealed for 72 hr. at 120 C.
9	248	E	1956	303-376	±3		66.33	33.67	
10	248	E	1956	319-441	±3		54.56	45.44	
11	248	E	1956	311-440	±3		95.18	4.82	
12	383		1956	307-511			98.0	2.0	Electrical conductivity ranging from 0.325 to 0.421 x 10^4 $ohm^{-1} cm^{-1}$ at 307.2 to 511.2 K respectively.
13	592	L	1959	464-902		Bi-Pb eutectic	55.5	44.5	Molten state; contained in a cavity 14.0 to 13.5 mm dia. and 140 to 210 mm long; measured in a vacuum of ~4 x 10^{-4} mm Hg; melting point 123.5 C; density ranging from 10.570 to 9.876 g cm^{-3} at 130 to 700 C respectively.

THERMAL CONDUCTIVITY OF
CADMIUM + BISMUTH ALLOYS
[Cd + Bi ≥ 99.50%; impurity ≤ 0.20% each]
THERMAL CONDUCTIVITY, Watts Cm⁻¹ K⁻¹
TEMPERATURE, K
Cd: M.P. 594.18 K
Bi: M.P. 544.525 K

FIG 91

SPECIFICATION TABLE NO. 91 THERMAL CONDUCTIVITY OF [CADMIUM + BISMUTH] ALLOYS

(Cd + Bi ≥ 99.50%; impurity ≤ 0.20% each)

[For Data Reported in Figure and Table No. 91]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cd	Bi	Composition (continued), Specifications and Remarks
1	230	L	1925	328.2			90.0	10.0	Approx. composition: Bi metal contained < 0.03 of total impurity, supplied by Baker; specimen 1.9 cm in diameter and 10 cm long, electrical conductivity 8.92 x 10^4 ohm^{-1} cm^{-1} 22 C.
2	230	L	1925	328.2			80.0	20.0	Similar to above specimen except electrical conductivity. 6.47 x 10^4 ohm^{-1} cm^{-1} at 22 C.
3	230	L	1925	328.2			70.0	30.0	Similar to above specimen except electrical conductivity. 5.24 x 10^4 ohm^{-1} cm^{-1} at 22 C.
4	230	L	1925	328.2			60.0	40.0	Similar to above specimen except electrical conductivity. 3.86 x 10^4 ohm^{-1} cm^{-1} at 22 C.
5	230	L	1925	328.2			50.0	50.0	Similar to above specimen except electrical conductivity. 3.51 x 10^4 ohm^{-1} cm^{-1} at 22 C.
6	383		1956	303-394			50.6	49.4	Approx. composition; electrical conductivity 4.84, 4.42, 4.255, 4.2, 4.04, 3.94, 3.905 and 3.82 x 10^4 ohm^{-1} cm^{-1} at 29.3, 57.4, 71.7, 79.9, 97.9, 107.9, 112.2 and 120.7 C respectively.
7	383		1956	304-396			67.7	32.3	Approx. composition; electrical conductivity 5.8, 5.68, 5.47, 5.24, 5.15, 4.85, 4.77 and 4.67 x 10^4 ohm^{-1} cm^{-1} at 30.7, 39.2, 55.7, 67.4, 78.1, 103.1, 113.5 and 122.9 C respectively.
8	383		1956	307-383			89.8	10.2	Approx. composition; electrical conductivity 8.45, 7.85, 7.52, 7.26, 6.95, 6.83 and 6.81 x 10^4 ohm^{-1} cm^{-1} at 33.8, 57.5, 72.4, 85.1, 94.2, 106.6, 109.6 C respectively.
9	383		1956	302-388			90.0	9.8	0.2 Pb; electrical conductivity 10.8, 10.11, 9.74, 8.97, 8.44 and 8.17 x 10^4 ohm^{-1} cm^{-1} at 28.8, 47.7, 61.4, 83.3, 105.8 and 114.9 C respectively.

SPECIFICATION TABLE NO. 99 THERMAL CONDUCTIVITY OF [COPPER + ALUMINUM] ALLOYS

(Cu + Al > 99.50%; impurity < 0.20% each)

[For Data Reported in Figure and Table No. 99]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Al	Composition (continued), Specifications and Remarks
1	55	L	1928	293-523		Aluminum bronze; 6	90.0	10.0	Approx. composition; specimen 2.53 cm in diameter and 38 cm long; chill-cast and annealed; electrical resistivity reported at 293, 348, 373, 423, 473 and 523 C respectively as 14.7, 15.6, 16.0, 16.7, 17.5 and 18.3 μ ohm cm.
2	135	L	1935	293, 473		100	99.77	0.22	0.01 Fe; specimen 0.75 in. in diameter and 8 in. long; rolled and annealed at 750 C for 2 hrs.; electrical conductivity reported at 20 and 200 C respectively as 41.91 x 10^4 and 27.59 x 10^4 ohm^{-1} cm^{-1}.
3	135	L	1935	293, 473		101	99.47	0.47	0.02 Fe; similar to above specimen; electrical conductivity reported at 20 and 200 C respectively as 32.10 x 10^4 and 22.91 x 10^4 ohm^{-1} cm^{-1}.
4	135	L	1935	293, 473		76	99.20	0.71	0.09 Fe; similar to above specimen; electrical conductivity reported at 20 and 200 C respectively as 23.40 x 10^4 and 17.95 x 10^4 ohm^{-1} cm^{-1}.
5	135	L	1935	293, 473		77	98.08	1.89	0.03 Fe; similar to above specimen except annealed at 700 C; electrical conductivity reported at 20, 200 C respectively as 15.91 x 10^4 and 13.00 x 10^4 ohm^{-1} cm^{-1}.
6	135	L	1935	293, 473		45	95.25	4.61	0.14 Fe; similar to above specimen; annealed at 700 C for 2 hrs.; electrical conductivity reported at 20, 200 C respectively as 10.26, 8.824 x 10^4 ohm^{-1} cm^{-1}.
7	135	L	1935	293, 473		46	92.15	7.72	0.13 Fe; specimen 0.75 in. in diameter and 8 in. long; rolled and annealed at 750 C for 3 1/2 hrs.; slowly cooled in furnace; electrical conductivity reported at 20 and 200 C respectively as 8.834 and 7.65 x 10^4 ohm^{-1} cm^{-1}.
8	135	L	1935	293, 473		102	90.56	9.37	0.07 Fe; similar to the above specimen; annealed at 750 C for 2 hrs. and very slowly cooled in furnace at 450 C for 18 hrs.; electrical conductivity reported at 20 and 200 C respectively as 8.24 and 7.056 x 10^4 ohm^{-1} cm^{-1}.
9	135	L	1935	293, 473		130	87.76	12.15	0.09 Fe; similar to the above specimen except electrical conductivity reported at 20 and 200 C respectively as 6.925 and 5.738 x 10^4 ohm^{-1} cm^{-1}.
10	67	L	1932	438.2			98.25	≈1.75	Specimen prepared from Al (containing 0.21 Fe, 0.29 Si) and high grade Cu; cast in iron mould 7 in. long and 9/16 in. in diameter; specimen 6 1/2 in. long and 1/2 in. in diameter; annealed at 500 C.

SPECIFICATION TABLE NO. 99 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Al	Composition (continued), Specifications and Remarks
11	67	L	1932	438.2			94.90	≈5.10	Similar to the above specimen.
12	67	L	1932	438.2			91.55	≈8.45	Similar to the above specimen.
13	67	L	1932	438.2			87.22	≈12.78	Similar to the above specimen.
14	230	L	1925	326.2			50.0	50.0	Approx. composition; total impurity <0.03 in each metal, specimen 1.9 cm in diameter and 10 cm long; supplied by Baker; electrical conductivity 15.3×10^4 ohm^{-1} cm^{-1} at 23 C.
15	230	L	1925	326.2			60.0	40.0	Similar to the above specimen; except electrical conductivity 10.6×10^4 ohm^{-1} cm^{-1} at 23 C.
16	230	L	1925	326.2			70.0	30.0	Similar to the above specimen; except electrical conductivity 9.76×10^4 ohm^{-1} cm^{-1} at 23 C.
17	230	L	1925	326.2			80.0	20.0	Similar to the above specimen except electrical conductivity 3.60×10^4 ohm^{-1} cm^{-1} at 23 C.
18	230	L	1925	326.2		Aluminum bronze	90.0	10.0	Similar to the above specimen except electrical conductivity 9.98×10^4 ohm^{-1} cm^{-1} at 23 C.

SPECIFICATION TABLE NO. 109 THERMAL CONDUCTIVITY OF [COPPER + MANGANESE] ALLOYS

(Cu + Mn > 99.50%; impurity ≤ 0.20% each)

[For Data Reported in Figure and Table No. 109]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Mn	Composition (continued), Specifications and Remarks
1	230	L	1925	332.2			90.0	10.0	Approx. composition; specimen ~5 cm long with cross section 0.3 cm^2; made from Cu (< 0.03 of total impurity) supplied by Baker, fused with Mn supplied by Eimer and Amend; electrical conductivity 2.76 x 10^4 ohm^{-1} cm^{-1} at 23 C.
2	230	L	1925	332.2			80	20	Similar to the above specimen except electrical conductivity 1.59 x 10^4 ohm^{-1} cm^{-1} at 23 C.
3	230	L	1925	332.2			70	30	Similar to the above specimen except electrical conductivity 1.11 x 10^4 ohm^{-1} cm^{-1} at 23 C.
4	230	L	1925	332.2			60	40	Similar to the above specimen except electrical conductivity 0.916 x 10^4 ohm^{-1} cm^{-1} at 23 C.
5	135	L	1935	293, 473		Bar 116	99.55	0.43	0.01 Fe, 0.01 Mg; specimen 0.75 in. in diameter and 8 in. long; supplied by American Brass Co.; annealed at 700 C for 2 hrs.; electrical conductivity 29.56 and 22.00 x 10^4 ohm^{-1} cm^{-1} at 20 and 200 C respectively.
6	135	L	1935	293, 473		Bar 117	99.05	1.05	0.01 Fe, 0.01 Mg; similar to the above specimen except electrical conductivity 19.07 and 15.84 x 10^4 ohm^{-1} cm^{-1} at 20 and 200 C respectively.
7	135	L	1935	293, 473		Bar 118	98.27	1.77	0.03 Fe, 0.01 Mg; similar to the above specimen except electrical conductivity 12.54 and 11.22 x 10^4 ohm^{-1} cm^{-1} at 20 and 200 C respectively.
8	135	L	1935	293, 473		Bar 119	95.34	4.55	0.06 Fe, 0.02 Mg; similar to the above specimen except electrical conductivity 5.567 and 5.446 x 10^4 ohm^{-1} cm^{-1} at 20 and 200 C respectively.
9	135	L	1935	293, 473		Bar 120	90.25	9.53	0.18 Fe, 0.02 Mg, 0.021 C; similar to the above specimen except electrical conductivity 2.814 and 2.829 x 10^4 ohm^{-1} cm^{-1} at 20 and 200 C respectively.
10	135	L	1935	293, 473		Bar 121	80.03	19.82	0.09 Fe, 0.02 Mg, 0.035 C; similar to the above specimen except electrical conductivity 1.453 and 1.474 x 10^4 ohm^{-1} cm^{-1} at 20 and 200 C respectively.
11	34		1927	80, 273		1	70	30	Approx. composition; coarse grain; electrical conductivity 0.784 and 0.743 x 10^4 ohm^{-1} cm^{-1} at 80 and 273 K respectively.

SPECIFICATION TABLE NO. 109 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Mn	Composition (continued), Specifications and Remarks
12	34		1927	80, 273		2	70	30	Approx. composition; medium grain; electrical conductivity 1.09 and 1.054 x 10^4 ohm^{-1} cm^{-1} at 80 and 273 K respectively.
13	34		1927	80, 273		3	70	30	Approx. composition, medium grain, electrical conductivity 0.902 and 0.863 x 10^4 ohm^{-1} cm^{-1} at 80 and 273 K respectively.
14	34		1927	80, 273		4	70	30	Approx. composition; fine grain; electrical conductivity 1.034 and 0.951 x 10^4 ohm^{-1} cm^{-1} at 80 and 200 C respectively.

[For Data Reported in Figure and Table No. 110]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Ni	Composition (continued), Specifications and Remarks
1	135	L	1935	293-473		Bar 107	99.73	0.28	0.11 Fe, 0.03 Mg; specimen 0.75 in. in diameter and 8 in. long; supplied by American Brass Co.; annealed at 800 C for 2 hrs.; electrical conductivity 45.70 and 29.11 x 10^4 $ohm^{-1} cm^{-1}$ at 20 C and 200 C respectively.
2	135	L	1935	293-473		Bar 108	99.47	0.54	0.02 Fe, 0.04 Mg; similar to the above specimen except annealed at 800 C for 3 hrs.; electrical conductivity 39.94 and 26.86 x 10^4 $ohm^{-1} cm^{-1}$ at 20 and 200 C respectively.
3	135	L	1935	293-473		Bar 109	97.94	1.97	0.02 Fe, 0.04 Mg; similar to the above specimen except annealed at 800 C for 4 hrs.; electrical conductivity 22.71 and 17.58 x 10^4 $ohm^{-1} cm^{-1}$ at 20 and 200 C respectively.
4	135	L	1935	293-473		Bar 110	94.92	5.09	0.01 Fe, 0.03 Mg; similar to the above specimen except electrical conductivity 12.39 and 10.64 x 10^4 $ohm^{-1} cm^{-1}$ at 20 and 200 C respectively.
5	135	L	1935	293-473		Bar 111	89.90	10.07	0.02 Fe, 0.03 Mg, 0.024 C; similar to the above specimen except electrical conductivity 7.07 and 6.46 x 10^4 $ohm^{-1} cm^{-1}$ at 20 and 200 C respectively.
6	135	L	1935	293-473		Bar 125	84.85	15.07	0.05 Fe, 0.01 Mg, 0.03 Mn; similar to the above specimen except electrical conductivity 5.094 and 4.795 x 10^4 $ohm^{-1} cm^{-1}$ at 20 and 200 C respectively.
7	135	L	1935	293-473		Bar 124	69.51	30.23	0.05 Fe, 0.05 Mg, 0.13 Mn; similar to the above specimen except electrical conductivity 2.754 and 2.730 x 10^4 $ohm^{-1} cm^{-1}$ at 20 and 200 C respectively.
8	154	L	1956	2.3-108		Russian cupro nickel NM-81.7	81.0	19.0	Specimen in strip form cut from a 6 x 5 mm tube; measured in helium, unannealed.
9	154	L	1956	2.5-76		Russian cupro nickel NM-81.6	81.0	19.0	The above specimen annealed at 800 C; measured in helium.
10	124	P	1930	321-984			79.8	20.0	0.2 Mn, trace Mg; specimen ~0.25 cm in diameter and ~35 cm long; chill cast, hot rolled and cold drawn then annealed at 700 C for 12 hrs.; electrical conductivity 3.54, 3.46, 3.33, 3.21, 3.12 and 3.02 x 10^5 $ohm^{-1} cm^{-1}$ at 48, 150, 315, 462, 575 and 711 C respectively.
11	124	P	1930	335-990			59.8	40.0	Similar to the above specimen except electrical conductivity 1.99, 1.99, 1.96 and 1.92 x 10^5 $ohm^{-1} cm^{-1}$ at 62, 266, 510 and 717 C respectively.

SPECIFICATION TABLE NO. 110 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Ni	Composition (continued), Specifications and Remarks
12	8	F	1914	273-373		Eureka	60.0	40.0	Approx. composition; specimen 6 mm in diameter and 9 mm long.
13	57	L	1927	21, 83			99.0	1.0	Specimen 7 cm long and 0.1 to 0.3 cm wide, drawn; electrical resistivity 2.97, 1.60 and 1.295 μ ohm cm at 0, -190 and -252 C respectively.
14	152	L	1949	10-20			70.0	30.0	Approx. composition; specimen 4.1 mm in diameter and 21 mm long, supplied by Yorkshire Copper Works Ltd., cold-worked.
15	75	L	1951	1.9-22			80.0	20.0	Approx. composition; average grain size 0.011 mm.
16	77	E	1900	291, 373			60.0	40.0	Density 8.92 g cm^{-3} at 18 C; electrical conductivity 2.04 and 2.037 x 10^4 ohm^{-1} cm^{-1} at 18 and 100 C respectively.
17	155	L	1951	3.3-78		CN 1	90.0	10.0	Specimen 1/8 in. in diameter; machined from an annealed bar; electrical resistivity 12.5, 12.72 and 14.68 μ ohm cm at 19.7, 78.9 and 296 K respectively.
18	155	L	1951	3.0-76		CN 2	90.0	10.0	Specimen 1/8 in. in diameter; cold-worked by rolling from 0.25 in. thick to 0.14 in. before being machined to size; electrical resistivity 12.65 and 14.69 μ ohm cm at 76.2 and 296 K respectively.
19	155	L	1951	3.6-79		CN 3	90.0	10.0	Specimen 1/8 in. in diameter; severely cold-worked, rolled from 0.5 $in.^2$ cross section to 0.22 x 0.24 in. before machining; electrical resistivity 12.63 and 14.65 μ ohm cm at 78.7 and 298 K respectively.
20	155	L	1951	3.4-79		CN 4	90.0	10.0	Single crystal; specimen 1/8 in. in diameter; electrical resistivity 13.0, 13.10 and 15.04 μ ohm cm at 20.5, 79.3 and 298 K respectively.
21	9	L	1951	3.0-91			60.0	40.0	36 gauge wire bound and soldered together.
22	67	L	1932	438.2			≥ 99.22	0.78	High grade electrolytic Cu with traces of impurities; specimen 6.5 in. long and 0.5 in. in diameter; annealed at 900 C.
23	67	L	1932	438.2			≥ 98.43	1.57	Similar to the above specimen.
24	67	L	1932	438.2			≥ 97.24	2.76	Similar to the above specimen.
25	67	L	1932	438.2			≥ 95.1	4.9	Similar to the above specimen.

SPECIFICATION TABLE NO. 110 (continued)

Curve No.	Ref. No.	Method Used*	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Ni	Composition (continued), Specifications and Remarks
26	230	L	1925	330.2			50	50	Approx composition; specimen ~5 cm long with cross section 0.3 cm^2; made from Cu (< 0.03 of total impurity) supplied by Baker, fused with Ni (99.75 to 99.85 pure including cobalt) supplied by International Nickel Co. of America; electrical conductivity 1.98 x 10^4 ohm^{-1}cm^{-1} at 25 C.
27	230	L	1925	330.2			60.0	40.0	Approx composition; similar to the above specimen except electrical conductivity 2.04 x 10^4 ohm^{-1}cm^{-1} at 25 C.
28	230	L	1925	330.2			70	30	Similar to the above specimen except electrical conductivity 2.48 x 10^4 ohm^{-1}cm^{-1} at 25 C.
29	230	L	1925	330.2			90	10	Similar to the above specimen except electrical conductivity 3.49 x 10^4 ohm^{-1}cm^{-1} at 25 C.
30	186	P	1928	305.2		Advance	55.0	45.0	Approx composition; impurity < 0.03.
31	131	C	1953	323-1173	± 2.0	Lohm	93.4	6.05	0.01 Mn, 0.01 Si; annealed at 900 C; lead used as comparative material.
32	219	L	1951	26-295	< 2.3	Constantan	55.0	45.0	
33	246	T	1919	273,373			89.94	10.06	Calculated composition; specimen rolled and drawn to 1 mm thick; heated 0.5 hr close to melting point; electrical conductivity 6.2 and 6.1 x 10^4 ohm^{-1}cm^{-1} at 0 and 100 C, respectively.
34	246	T	1919	273,373			[illegible]	[illegible]	Similar to the above specimen except electrical conductivity 3.5 and 3.3 x 10^4 ohm^{-1}cm^{-1} at 0 and 100 C, respectively.
35	246	T	1919	273,373			60.[illegible]	39.98	Similar to the above specimen except electrical conductivity 2.0 and 2.0 x 10^4 ohm^{-1}cm^{-1} at 0 and 100 C, respectively.
36	433	L	1940	78.2		8	≈70.05	≈29.89	Cu-Ni alloy containing 0.03 Mn, 0.03 Fe, and traces of other impurities, made from electrolytic Ni (containing 0.53 Co, 0.05 Fe, 0.02 Al) and electrolytic Cu (containing 0.015 Sb, 0.01 Fe, 0.007 S and trace of P); specimen 4.0 mm in dia and 6 mm long; electrical resistivity 40.3 μohm cm at -195 C.
37	433	L	1940	78.2		9	≈80.11	≈19.83	The alloy containing 0.04 Mn, 0.02 Fe and traces of other impurities made from the same materials as above; electrical resistivity 27.1 μohm cm at -195 C.

SPECIFICATION TABLE NO. 110 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Ni	Composition (continued), Specifications and Remarks
38	433	L	1940	78.2		10	86.05	13.84	0.11 Fe and trace Mn; made from the same material as above; electrical resistivity 17.6 μ ohm cm at -195 C.
39	433	L	1940	78.2		11	90.39	9.47	0.14 Fe, traces of Mn and other impurities; made from the same materials as above; electrical resistivity 11.9 μ ohm cm at -195 C.
40	433	L	1940	78.2		12	96.24	3.67	0.09 Fe and traces of other impurities; as above but electrical resistivity 3.43 μ ohm cm at -195 C.
41	433	L	1940	78.2		13	98.94	1.03	0.03 Fe and traces of other impurities; as above but electrical resistivity 1.039 μ ohm cm at -195 C.
42	435	L	1900	291.2			54.0	46.0	Approx. composition; density 8.89 g cm^{-3}; electrical conductivity 1.99 x 10^5 ohm^{-1} cm^{-1} at 18 C.
43	377		1957	336-825			99.05	0.70	0.1 Be, 0.15 Co; electrical conductivity 25.8, 23.1, 20.4, 18.25, 16.5, 15.67 and 14.33 x 10^4 ohm^{-1} cm^{-1} at 63.0, 114.6, 195, 273, 375.8, 433.5 and 551.3 C respectively.

11	133	L	1930	329-512	2	18	69.14	30.81	0.03 Fe, 0.02 Pb; polycrystalline, grain dia 0.075 mm; specimen ~13.25 in. long, 0.750 in dia; annealed at 650 C for 0.75 hr; electrical conductivity 15.857 x 10^4 ohm^{-1} cm^{-1} at 20 C.
12	133	L	1930	329-511	2	21	65.43	34.53	0.01 Fe, 0.03 Pb; polycrystalline; grain dia 0.080 mm; specimen ~13.25 in. long, 0.750 in. dia; annealed at 650 C for 0.75 hr; electrical conductivity 15.325 x 10^4 ohm^{-1} cm^{-1} at 20 C.
13	133	L	1930	326-505	2	88	54.96	45.02	0.01 Fe; polycrystalline; grain dia 0.040 mm; specimen ~13.25 in. long, 0.750 in. dia; annealed at 650 C for 2 hr; electrical conductivity 20.466 x 10^4 ohm^{-1} cm^{-1} at 20 C.
14	135	L	1935	293,473		19	66.24	33.72	0.01 Fe, 0.03 Pb; annealed at 700 C.
15	6	L	1931	351-703		Brass 70/30	70	30	Approx. composition; specimen ~7.5 cm long, 0.585 cm dia; density 8.44 g cm^{-3} at 22 C.
16	88		1908	108-298		Brass 70/30	70	30	Specific gravity 8.44 at 22 C.
17	234	L	1957	2.8-123	1	25	98.37	1.63	Specimen ~8 cm long, 0.5 cm dia; supplied by Johnson, Matthey and Co. Ltd; drawn; ρ_0 = 0.425 μohm cm.
18	234	L	1957	2.0-130	1	2	98.37	1.63	The above specimen annealed at 500 C for 4 hr in a He atmosphere; ρ_0 = 0.38 μohm cm.
19	234	L	1957	2.1-91	1	55	94.63	5.37	Specimen ~8 cm long, 0.5 cm dia; supplied by Johnson, Matthey and Co. Ltd; drawn; ρ_0 = 1.22 μohm cm.
20	234	L	1957	2.5-91	1	5	94.63	5.37	The above specimen annealed at 500 C for 4 hr in a He atmosphere; ρ_0 = 1.12 μohm cm.
21	234	L	1957	1.9-91	1	10	90.02	9.98	Specimen ~8 cm long, 0.5 cm dia; supplied by Johnson, Matthey and Co. Ltd; drawn; annealed in a He atmosphere at 500 C for 4 hr; ρ_0 = 1.88 μohm cm.
22	234	L	1957	1.9-91	1	20	80.52	19.48	Similar to the above specimen except ρ_0 = 2.97 μohm cm.

SPECIFICATION TABLE NO. 118 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Zn	Composition (continued), Specifications and Remarks
23	234	L	1957	2.5-91	1	30S	68.13	31.87	Specimen 8 cm long, 0.5 cm dia; supplied by Johnson, Matthey and Co. Ltd; drawn; ρ_0 4.3 μohm cm.
24	234	L	1957	2.2-91	1	30	68.13	31.87	The above specimen annealed in a He atmosphere at 500 C for 4 hr; ρ_0 3.60 μohm cm.
25	235	L	1944	302-335		Brass			Specimen 2.565 cm long, cross sectional area 5.017cm².
26	235	L	1944	314-344		Brass			Specimen 2.570 cm long, cross sectional area 3.447cm².
27	233	L	1957	1.9-121			~~98~~ [illegible]	~~2~~ [illegible]	Approx. composition specimen 8 cm long, 0.5 cm dia; drawn, annealed at 850 C for 4 hr; ρ_0 0.56 μohm cm.
28	233	L	1957	2.0-91			~~95~~ [illegible]	~~5~~ [illegible]	Similar to the above specimen except ρ_0 1.20 μohm cm.
29	233	L	1957	2.2-91		Commercial bronze	~~90~~ [illegible]	~~10~~ [illegible]	Similar to the above specimen except ρ_0 1.94 μohm cm.
30	236	L	1959	2.0-91		1	68	32	Approx. composition: α brass; machined from an annealed and torsionally deformed bar.
31	236	L	1959	6.5-91		2	68	32	Similar to the above specimen but annealed (after machining) up to 250 C at a rate of 6 C min^{-1}.
32	236	L	1959	2.1-91		3	68	32	Similar to the above specimen but annealed (after machining) up to 290 C at a rate of 6 C min^{-1}.
33	236	L	1959	2.0-91		4	68	32	Similar to the above specimen but annealed (after machining) up to 400 C at a rate of 6 C min^{-1}.
34	246	T	1919	273,373			92.65	7.35	Rolled and drawn; annealed close to the melting point for 1/2 hr.
35	246	T	1919	273,373			85.65	14.35	Similar to the above specimen.
36	246	T	1919	273,373			72.11	27.89	Similar to the above specimen.
37	246	T	1919	273,373			66.97	33.03	Similar to the above specimen.
38	425	L	1924	90,273		Red brass	82.	18	Polycrystalline; fine grained.
39	425	L	1924	90,273		Red brass	82	18	Polycrystalline; coarse grained.
40	517	L	1959	2.3-4.4		Brass	85	15	α brass; prepared from Johnsen, Matthey spectrographically standardized metals; specimen 2.5 mm dia, 4 cm long; annealed just below melting point for 40 hr.
41	517	L	1959	2.3-4.5		Brass	85	15	The above specimen drawn to produce 4.6% strain.

SPECIFICATION TABLE NO. 118 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Zn	Composition (continued), Specifications and Remarks
42	517	L	1959	2.4-4.5		Brass	85	15	The above specimen drawn to produce 10.4% strain.
43	517	L	1959	2.3-4.4		Brass	85	15	The above specimen drawn to produce 19.8% strain.
44	440	L, R	1940	78, 273		1	95.429	4.540	α-brass with impurities of: 0.014 Sb, 0.010 Fe, 0.007 S, and trace As; calculated composition; annealed in N_2 for 20 hr at 380-400 C.
45	440	L, R	1940	78, 273		2	92.791	7.180	Similar to the above specimen except 0.014 Sb, 0.009 Fe, 0.006 S and trace As.
46	440	L, R	1940	78, 273		3	86.842	13.130	Similar to the above specimen except 0.013 Sb, 0.009 Fe, 0.006 S, and trace As.
47	440	L, R	1940	78, 273		4	82.551	17.420	Similar to the above specimen except 0.012 Sb, 0.008 Fe, 0.006 S, and trace As.
48	440	L, R	1940	78, 273		5	79.704	20.270	Similar to the above specimen.
49	440	L, R	1940	78, 273		6	75.716	24.560	Similar to the above specimen except 0.011 Sb, 0.008 Fe, 0.005 S, and trace As.
50	440	L, R	1940	78, 273		7	69.978	30.000	Similar to the above specimen except 0.011 Sb, 0.007 Fe, 0.005 S, and trace As.
51	440	L, R	1940	78, 273		8	64.030	35.95	Similar to the above specimen except 0.010 Sb, 0.006 Fe, 0.004 S, and trace As.
52	440	L, R	1940	78, 273		9	62.281	37.700	α+β brass; impurities: 0.009 Sb, 0.006 Fe, 0.004 S, and trace As; calculated compositions; annealed in N_2 at 380-400 C for 20 hr.
53	440	L, R	1940	78, 273		10	59.911	40.070	Similar to the above specimen.
54	440	L, R	1940	78, 273		11	55.602	44.38	Similar to the above specimen except 0.008 Sb, 0.006 Fe, 0.004 S, and trace As.
55	440	L, R	1940	78, 273		12	51.073	48.910	β-brass; impurities: 0.008 Sb, 0.005 Fe, 0.004 S, and trace As; calculated composition; annealed in N_2 at 380-400 C for 20 hr.
56	518	L	1960	1.4-4.0	±5	Z4	95.4	4.59	0.01 Pb; annealed for 21 hr at 540 C; electrical resistivity 1.13 and 1.08 μ ohm cm at 1.05 and 4.2 K, respectively.
57	518	L	1960	1.4-4.0	±5	Z15	84.53	15.43	0.02 Fe, 0.02 Pb; annealed for 21 hr at 540 C; electrical resistivity 2.55 and 2.36 μ ohm cm at 1.05 and 4.2 K, respectively.

SPECIFICATION TABLE NO. 118 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Cu	Zn	Composition (continued), Specifications and Remarks
58	518	L	1960	1.4–4.0	±5	Z20	86.56	13.43	0.01 Fe, coldworked; annealed at 500 C for 17 hr; electrical resistivity 2.73 and 2.58 μohm cm at 1.05 and 4.2 K, respectively.
59	518	L	1960	1.4–4.0	±5	Z30	69.95	30.02	0.02 Fe, 0.01 Pb; annealed for 21 hr at 540 C; electrical resistivity 4.22 and 4.10 μohm cm at 1.05 and 4.2 K, respectively.

THERMAL CONDUCTIVITY OF GERMANIUM + SILICON ALLOYS

[Ge + Si ≥ 99.50%; impurity ≤ 0.20% each]

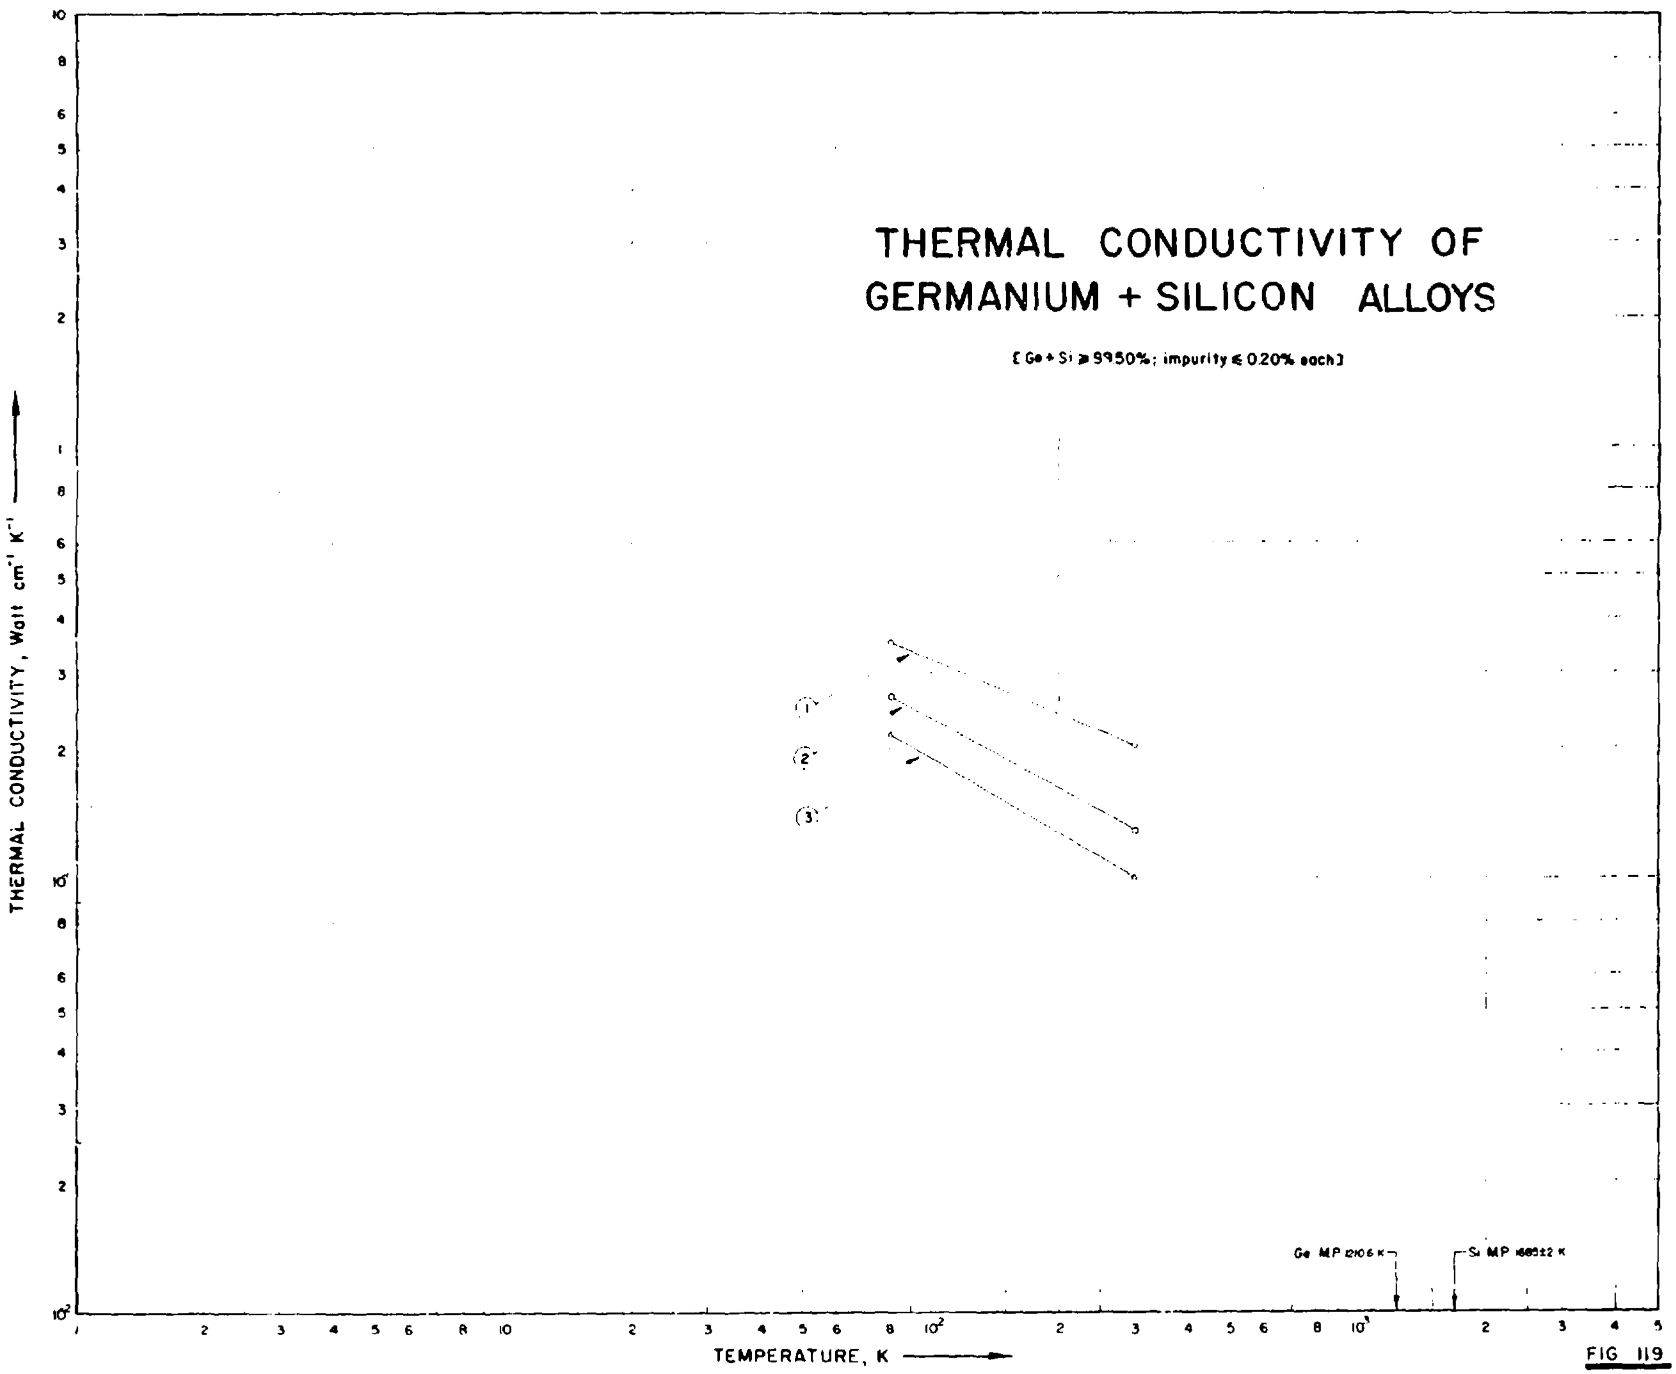

FIG 119

SPECIFICATION TABLE NO. 119 THERMAL CONDUCTIVITY OF GERMANIUM - SILICON ALLOYS

(Ge + Si ≥ 99.50%, impurity ≤ 0.20% each)

For Data Reported in Figure and Table No. 119

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ge	Si	Composition (continued), Specifications and Remarks
1	263	L	1958	80-300			95.44	4.56	p-type; calculated composition; In doped; lattice constant 5.65; specimen 5x5x15 mm; grown by zone leveling technique; grain size ~1 cc (dia); measured in a vacuum of 10 [illegible] mm Hg.
2	263	L	1958	80-300			82.76	17.24	Similar to the above specimen except lattice constant 5.568.
3	263	L	1958	80-300			67.00	33.00	Similar to the above specimen except lattice constant 5.527.

DATA TABLE NO. 119 THERMAL CONDUCTIVITY OF [GERMANIUM + SILICON] ALLOYS

(Ge + Si > 99.50%; impurity < 0.20% each)

19	232	L	1957	457.7		III			The above specimen annealed 30 hrs at 200 C.
20	232	L	1957	444.7		III			The above specimen annealed 40 hrs at 200 C.
21	246	T	1919	273, 373			96.73	3.27	Calculated composition; rolled and drawn to 1 mm dia wire; annealed close to melting point for 0.5 hr; electrical conductivity 14.3 and 13.4 x 10^4 ohm⁻¹ cm⁻¹ at 0 and 100 C respectively.
22	246	T	1919	273, 373			92.55	7.45	Similar to the above specimen except electrical conductivity 8.5 and 8.2 x 10^4 ohm⁻¹ cm⁻¹ at 0 and 100 C respectively.

SPECIFICATION TABLE NO. 123 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Au	Cu	Composition (continued), Specifications and Remarks
23	246	T	1919	273,373			87.77	12.23	Similar to the above specimen except electrical conductivity 6.3 and 5.9 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
24	246	T	1919	273,373			59.25	40.75	Similar to the above specimen except electrical conductivity 5.0 and 4.6 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
25	430	T	1924	273.2			50.8	49.2	Specimen rolled and drawn to 1 mm^2 cross sectional area; 3 cm long; annealed close to melting point for 0.5 hr; electrical resistivity at 273 K, $\rho(273)$ = 10.8 μohm cm.
26	430	T	1924	273.2			54.0	46.0	Similar to the above specimen except $\rho(273)$ = 11.4 μohm cm.
27	430	T	1924	273.2			57.0	43.0	Similar to the above specimen except $\rho(273)$ = 11.8 μohm cm.
28	430	T	1924	273.2			62.6	37.4	Similar to the above specimen except $\rho(273)$ = 13.0 μohm cm.
29	430	T	1924	273.2			67.2	32.8	Similar to the above specimen except $\rho(273)$ = 13.6 μohm cm.
30	430	T	1924	273.2			71.9	28.1	Similar to the above specimen except $\rho(273)$ = 10.5 μohm cm.
31	430	T	1924	273.2			78.1	21.9	Similar to the above specimen except $\rho(273)$ = 7.6 μohm cm.
32	430	T	1924	273.2			78.2	21.8	Similar to the above specimen except $\rho(273)$ = 7.6 μohm cm.
33	430	T	1924	273.2			78.9	21.1	Similar to the above specimen except $\rho(273)$ = 8.4 μohm cm.
34	430	T	1924	273.2			82.1	17.9	Similar to the above specimen except $\rho(273)$ = 11.6 μohm cm.
35	430	T	1924	273.2			82.4	17.6	Similar to the above specimen except $\rho(273)$ = 11.6 μohm cm.
36	430	T	1924	273.2			87.5	12.5	Similar to the above specimen except $\rho(273)$ = 11.6 μohm cm.
37	430	T	1924	273.2			94.1	5.9	Similar to the above specimen except $\rho(273)$ = 8.0 μohm cm.
38	58	L	1934	80,92		11	89.6	10.4	Polycrystalline specimen; cast; electrical resistivity at 83 K, $\rho(83)$ = 927 μohm cm.
39	58	L	1934	22-80		11a	89.6	10.4	The above specimen annealed 40 hrs at 365 C in vacuo; $\rho(83)$ = 927 μohm cm.
40	58	L	1934	22-91		12	96.9	3.10	Polycrystalline specimen; cast; $\rho(83)$ = 434.5 μohm cm.
41	58	L	1934	21-91		13	98.43	1.57	Polycrystalline specimen; cast; $\rho(83)$ = 435.3 μohm cm.
42	58	L	1934	79-91		14a	50.1	49.9	Polycrystalline specimen; cast; quenched from 800 C; $\rho(83)$ = 664 μohm cm.
43	58	L	1934	87.4		14b	50.1	49.1	The above specimen annealed at ~400 C for 20 hrs; $\rho(83)$ = 323 μohm cm.
44	58	L	1934	79,92		14c	50.1	49.1	The above specimen annealed at ~360 C for 32 hrs; $\rho(83)$ = 312.6 μohm cm.

SPECIFICATION TABLE NO. 123 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Au	Cu	Composition (continued), Specifications and Remarks
45	58	L	1934	80, 92		14d	50.1	49.1	The above specimen annealed at ~820 C for 2 hrs then quenched.
46	58	L	1934	22-89		14e	50.1	49.1	The above specimen measured after 5 months; ρ(83) = 988 μohm cm.
47	58	L	1934	21-81		14f	50.1	49.1	The above specimen annealed at ~325 C for 40 hrs; ρ(83) = 341 μohm cm.
48	58	L	1934	86.9		15a	75.6	24.4	Polycrystalline specimen, cast; quenched from 800 C; ρ(83) = 1157 μohm cm.
49	58	L	1934	85, 85		15b	75.6	24.4	The above specimen annealed at 360 C for 22 hrs; ρ(83) = 175.3 μohm cm.
50	58	L	1934	81, 92		15c	75.6	24.4	The above specimen annealed at 345 C for 30 hrs; ρ(83) = 222.8 μohm cm.
51	58	L	1934	79-91		15d	75.6	24.4	The above specimen annealed at 325 C for 30 hrs; ρ(83) = 179.7 μohm cm.
52	58	L	1934	79, 91		15e	75.6	24.4	The above specimen annealed at 800 C for 2 hrs; quenched; ρ(83) = 917.0 μohm cm.
53	58	L	1934	22-79		15f	75.6	24.4	The above specimen measured after 4 months; ρ(83) = 790.0 μohm cm.
54	58	L	1934	21-80		15g	75.6	24.4	The above specimen annealed at ~325 C for 30 hrs; ρ(83) = 182.6 μohm cm.

(In + Sn ≥ 99.50%; impurities ≤ 0.20%)

[For Data Reported in Figure and Table No. 131]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) In	Sn	Composition (continued), Specifications and Remarks
1	880	L	1965	0.5-1.3	±1	In 1	99	1	Supplied by American Smelting and Refining Co.; a rod of 3 mm dia; annealed at 130 C for six months; electrical resistivity 0.37×10^{-6} ohm cm at 4.2 K; normal-state conductivity was measured in a longitudinal magnetic field of 900 gauss.
2	880	L	1965	0.4-1.4	±1	In 2			The above specimen bent repeatedly at room temperature before the measurement.

SPECIFICATION TABLE NO. 159 THERMAL CONDUCTIVITY OF [NICKEL + COPPER] ALLOYS

(Ni + Cu > 99.50%; impurity < 0.20% each)

[For Data Reported in Figure and Table No. 159]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ni	Cu	Composition (continued), Specifications and Remarks
1	124	P	1930	325-970			~60	~40	0.2 Mn, trace Mg; annealed at 700 C; density 8.81 g cm^{-3}; electrical conductivity ranging from 1.88 to 1.74 x 10^4 ohm^{-1} cm^{-1} at 52 to 697 C.
2	124	P	1930	317-966			~80	~20	0.2 Mn, trace Mg; annealed at 700 C; density 8.82 g cm^{-3}; electrical conductivity ranging from 3.36 to 1.96 x 10^4 ohm^{-1} cm^{-1} at 44 to 693 C.
3	230	L	1925	330			80	20	Prepared by fusing Ni (99.75 to 99.85 pure, supplied by International Nickel Co.) and Cu (< 0.03 impurities, supplied by Baker); specimen ~5.5 cm long, 0.3 cm^2 cross sectional area; electrical conductivity 3.00 x 10^4 ohm^{-1} cm^{-1} at 25 C.
4	230	L	1925	330			70	30	Similar to the above specimen except electrical conductivity 2.17 x 10^4 ohm^{-1} cm^{-1} at 25 C.
5	230	L	1925	330			60	40	Similar to the above specimen except electrical conductivity 2.02 x 10^4 ohm^{-1} cm^{-1} at 25 C.
6	230	L	1925	330			50	50	Similar to the above specimen except electrical conductivity 1.98 x 10^4 ohm^{-1} cm^{-1} at 25 C.
7	246	T	1919	273, 373			60.93	39.07	Rolled and drawn; annealed close to melting point for 1/2 hr.
8	246	T	1919	273, 373			81.63	18.37	Similar to the above specimen.
9	917	E	1965	1.6-111	0.5-5	C			0.649 ± 0.104 Cu from x-ray microanalysis (0.865 Cu from residue resistivity measurement); specimen 4 mm in dia; supplied by Johnson Matthey and Co.; chill cast from J.M. 890 Ni and J.M. 30 Cu; annealed for 12 hrs at 850 C; electrical resistivity 1.0 x 10^{-3}, 4.99 x 10^{-3}, 1.422 x 10^{-2}, 3.16 x 10^{-2}, 4.27 x 10^{-2}, 7.48 x 10^{-2} and 8.79 x 10^{-2} μohm cm at 4.1, 10.1, 16.0, 21.8, 25.2, 31.8 and 34.1 K respectively.
10	917	E	1965	1.6-107	0.5-5	D			1.65 ± 0.32 Cu from x-ray microanalysis (1.73 Cu from residue resistivity measurement); specimen 4 mm in dia; supplied by Johnson Matthey and Co.; chill cast from J.M. 890 Ni and J.M. 30 Cu; annealed for 12 hrs at 850 C; electrical resistivity 1.01 x 10^{-3}, 5.12 x 10^{-3}, 2.12 x 10^{-2}, 3.57 x 10^{-2}, 5.63 x 10^{-2}, and 8.185 x 10^{-2} μohm cm at 3.4, 7.4, 15.8, 20.1, 24.8 and 29.6 K, respectively.

SPECIFICATION TABLE NO. 159 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ni	Cu	Composition (continued), Specifications and Remarks
11	917	E	1965	2.3-82.4	0.5-5	E			4.52 ± 0.65 Cu from x-ray microanalysis (5.28 Cu from residue resistivity measurement); specimen 4 mm in dia; supplied by Johnson Matthey and Co.; chill cast from J.M. 890 Ni and J.M. 30 Cu; annealed for 12 hrs at 850 C; electrical resistivity 9.02×10^{-3}, 2.01×10^{-2}, 4.67×10^{-2} and 8.71×10^{-2} μohm cm at 8.5, 12.2, 21.7 and 29.3 K, respectively.
12	917	E	1965	2.0-111	0.5-5	F			0.036 ± 0.054 Cu from x-ray microanalysis (0.172 Cu from residue resistivity measurement); specimen 4 mm in dia; supplied by *Johnson* Matthey and Co.; chill cast from J.M. 890 Ni and J.M. 30 Cu; annealed for 12 hrs at 850 C; electrical resistivity 1.1×10^{-2}, 4.634×10^{-2}, 1.05×10^{-2}, 2.4×10^{-2} 4.63×10^{-2} and 7.15×10^{-2} μohm cm at 6.3, 1.2, 1.6, 21.9, 28.9 and 34.6 K, respectively.

THERMAL CONDUCTIVITY OF PALLADIUM + COPPER ALLOYS

[Pd + Cu ≥ 99.50%; impurity ≤ 0.20% each]

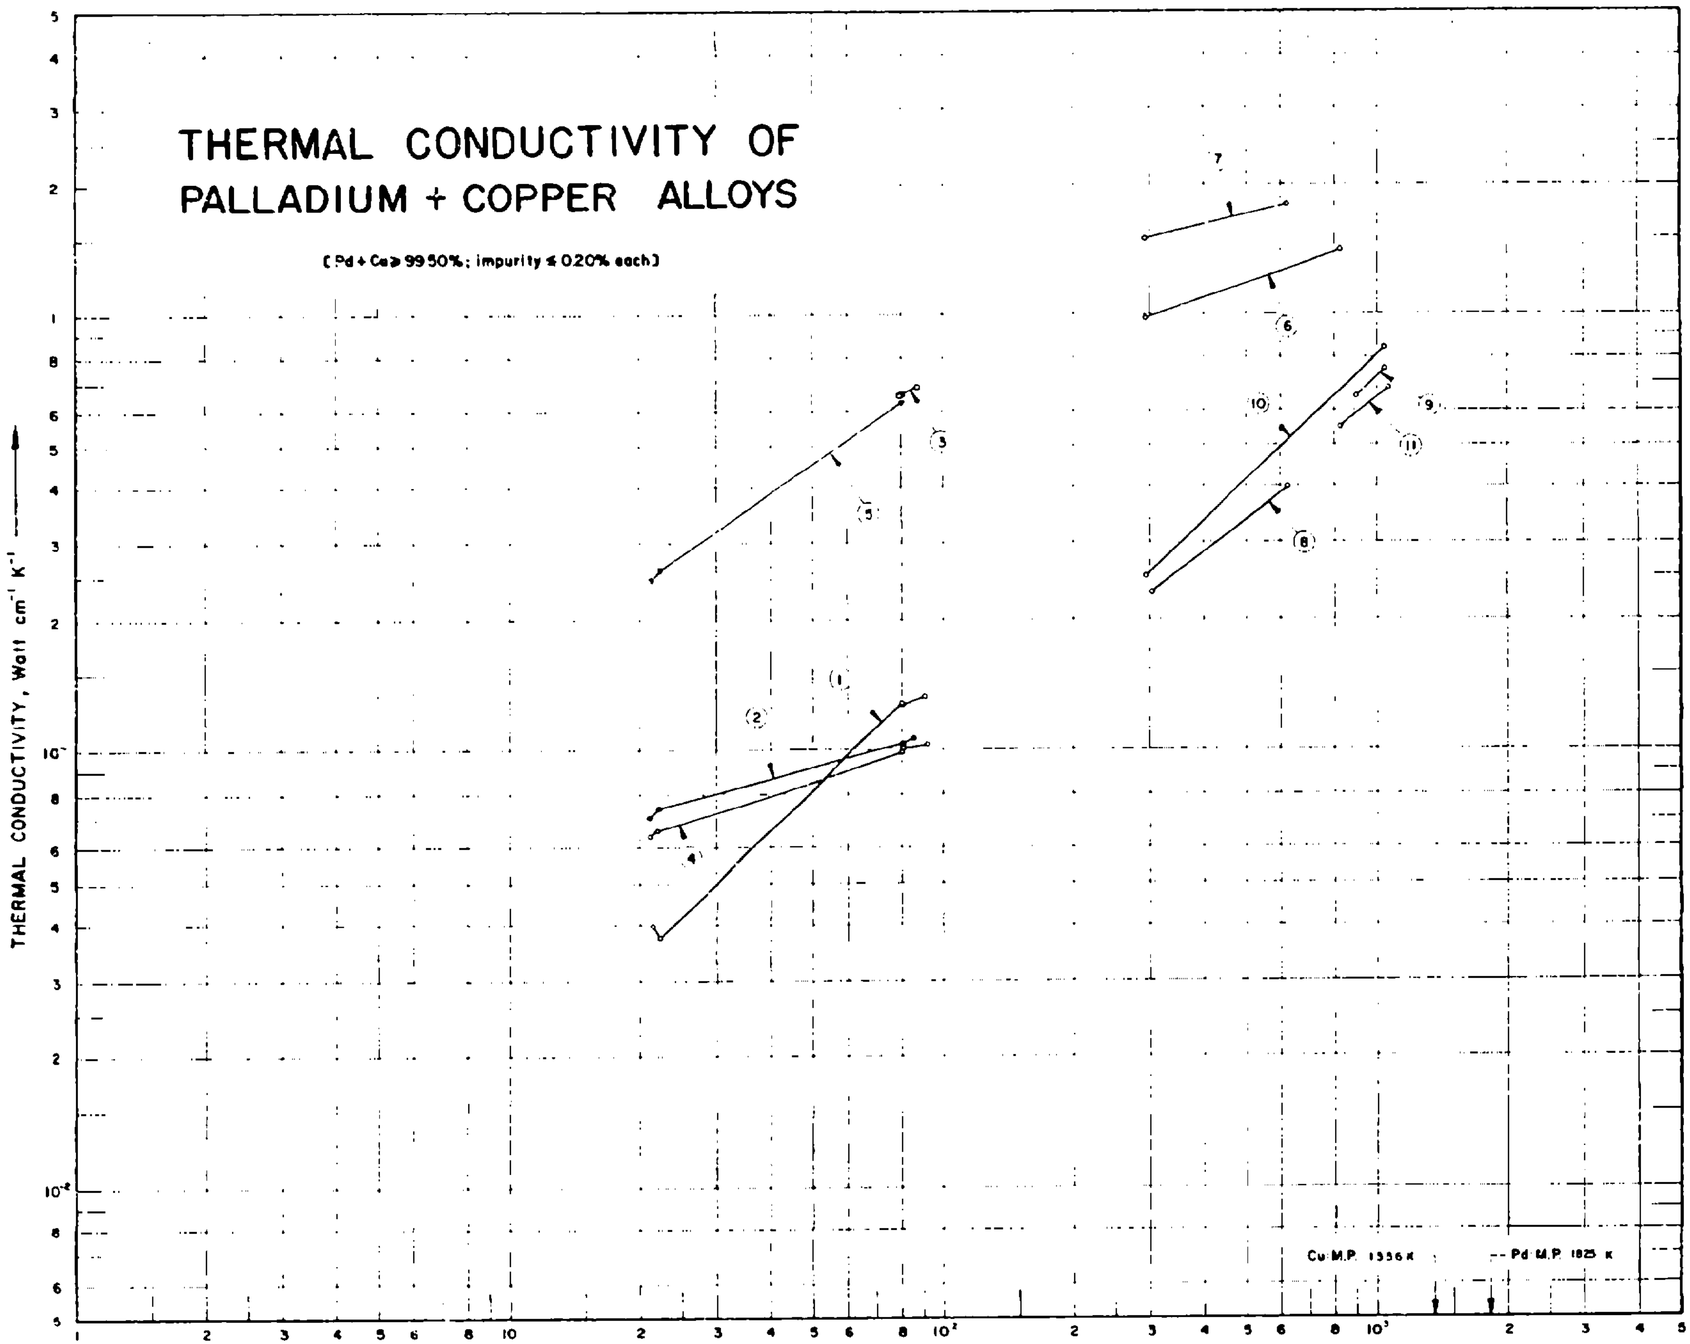

FIG 164

SPECIFICATION TABLE NO. 164 THERMAL CONDUCTIVITY OF [PALLADIUM + COPPER] ALLOYS

(Pd + Cu ≥ 99.50%; impurity ≤ 0.20% each)

[For Data Reported in Figure and Table No. 164]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Pd	Cu	Composition (continued), Specifications and Remarks
1	58	L	1934	21-91		18	90.8	9.2	Unannealed polycrystal; ρ(0C) = 28.05 μohm cm.
2	58	L	1934	21-85		19	62.7	37.3	Annealed; electrical resistivity 36.8 and 37.15 μohm cm at 275.15 and 291.60 K, respectively.
3	58	L	1934	79-87		21a	57.8	42.2	Annealed; electrical resistivity 5.1 and 5.32 μohm cm at 273.2 and 292.6 K, respectively.
4	58	L	1934	21-92		21b	57.8	42.2	The above specimen annealed in vacuo for 2 hrs at ~850 C.
5	58	L	1934	21-80		21c	57.8	42.2	The above specimen annealed at ~325 C for 30 hrs.
6	391	L	1958	293, 823	3		52.75	47.25	Calculated composition; specimen from a 0.2 mm thick sheet; cold rolled, annealed for 2 hrs at ~650 C; ordered atomic arrangement.
7	391	L	1958	293, 623	3		57.81	42.19	Similar to the above specimen.
8	391	L	1958	303, 623	3		70.67	29.33	Similar to the above specimen.
9	391	L	1958	893, 1048	3		52.75	47.25	Similar to the above specimen except disordered atomic arrangement.
10	391	L	1958	293, 1048	3		57.81	42.19	Similar to the above specimen.
11	391	L	1958	821, 1073	3		70.67	29.33	Similar to the above specimen.

THERMAL CONDUCTIVITY OF SILVER + CADMIUM ALLOYS
[Ag + Cd ≥ 99.50%; impurity ≤ 0.20% each]
FIG 187
TEMPERATURE, K
THERMAL CONDUCTIVITY, Watt cm⁻¹ K⁻¹

SPECIFICATION TABLE NO. 187 THERMAL CONDUCTIVITY OF [SILVER + CADMIUM] ALLOYS

(Ag + Cd ≥ 99.50%; impurity ≤ 0.20% each)

[For Data Reported in Figure and Table No. 187]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ag	Cd	Composition (continued), Specifications and Remarks
1	28	C	1951	410-646		5A	94.65	5.35	Cast and machined; cylindrical specimen slight porosity on axis; Armco iron used as standard.
2	28	C	1951	420-608		12B	87.1	12.9	Similar to the above with 25 internal voids 1/8 to 1/32 in. in dia.
3	28	C	1951	412-648		20A	77.8	22.0	Cast, cold-rolled (67% reduction), machined; Armco iron used as standard.
4	28	C	1951	408-[illegible]		25A	75.2	24.5	Similar to the above specimen.
5	28	C	1951	405-62[illegible]		30A	68.1	31.8	Similar to the above specimen.
6	28	C	1951	395-604		38A	64.35	35.65	Cast and machined; cylindrical specimen; small voids visible throughout; Armco iron used as standard.
7	240	L	1956	2.0-127			98.04	1.96	Supplied by Johnson, Matthey and Co., Ltd.; annealed at 530 C; ρ_0 = 0.62 μohm cm; electrical resistivity at 293 K; $\rho(293)$ = 2.26 μohm cm.
8	240	L	1956	2.1-91			98.04	1.96	The above specimen before annealing.
9	240	L	1956	2.2-159			95.09	4.91	Supplied by Johnson, Matthey and Co., Ltd.; annealed at 530 C; ρ_0 = 1.38 μohm cm; $\rho(293)$ = 3.13 μohm cm.
10	240	L	1956	1.9-1[illegible]			90.49	9.51	Supplied by Johnson, Matthey and Co., Ltd.; annealed at 500 C.
11	240	L	1956	2.3-91			90.49	9.51	Supplied by Johnson, Matthey and Co., Ltd.; annealed at 610 C. ρ_0 = 2.26 μohm cm, $\rho(293)$ = 4.09 μohm cm.
12	240	L	1956	2.0-149			80.79	19.21	Supplied by Johnson, Matthey and Co., Ltd.; annealed at 500 C; ρ_0 = 3.30 μohm cm; $\rho(293)$ = 5.82 μohm cm.
13	240	L	1956	2.0-148			80.79	19.21	The above specimen before annealing.
14	240	L	1956	2.0-145			70.03	29.97	Supplied by Johnson, Matthey and Co., Ltd.; annealed at 500 C; ρ_0 = 3.67 μohm cm, $\rho(293)$ = 6.22 μohm cm.
15	246	T	1919	273, 373			95.84	4.16	Calculated composition; wire, 1 mm dia; rolled and drawn; annealed for 1/2 hr close to melting point; electrical conductivity, 29.3 and 24.2 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
16	246	T	1919	273, 373			90.86	9.14	Similar to the above specimen except electrical conductivity 21.0 and 19.2 x 10^4 ohm^{-1} cm^{-1} at 0 and 100 C, respectively.
17	246	T	1919	273, 373			87.66	12.34	Similar to the above specimen except electrical conductivity 19.2 and 18.0 x 10^4 ohm^{-1} cm^{-1} at 0 and 100 C, respectively.
18	246	T	1919	273, 373			83.13	16.87	Similar to the above specimen except electrical conductivity 17.1 and 14.9 x 10^4 ohm^{-1} cm^{-1} at 0 and 100 C, respectively.

SPECIFICATION TABLE NO. 189 THERMAL CONDUCTIVITY OF [SILVER + GOLD] ALLOYS

(Ag + Au ≥ 99.50%, ≤ 0.20% each)

[For Data Reported in Figure and Table No. 189]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ag	Au	Composition (continued), Specifications and Remarks
1	58	L	1931	22-92			99.3	0.7	Calculated composition, wire specimen; electrical resistivity 0.163, 0.473, and 1.63 μohm cm at 0, −190, and −251 C, respectively.
2	58	L	1931	22-92			62.2	37.8	Calculated composition; single crystal; wire specimen; electrical resistivity 6.87, 7.25, and 8.57 μohm cm at 0, −190, and −251 C, respectively.
3	246	T	1919	273,373			95.88	4.12	Calculated composition; wire, 1 mm dia; rolled and drawn; annealed close to melting point for 0.5 hr.
4	246	T	1919	273,373			91.22	8.78	Similar to the above specimen, electrical conductivity 29.3 and 24.2 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
5	246	T	1919	273,373			80.74	19.26	Similar to the above specimen except electrical conductivity 19.5 and 16.0 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
6	246	T	1919	373.2			76.34	23.66	Similar to the above specimen except electrical conductivity 14.7 and 13.5 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
7	246	T	1919	273,373			68.63	31.37	Similar to the above specimen except electrical conductivity 12.5 to 11.5 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.
8	246	T	1919	273,373			55.84	44.16	Similar to the above specimen except electrical conductivity 10.3 and 9.7 x 10^4 $ohm^{-1}cm^{-1}$ at 0 and 100 C, respectively.

FIGURE SHOWS ONLY 7 OF THE CURVES REPORTED IN TABLE

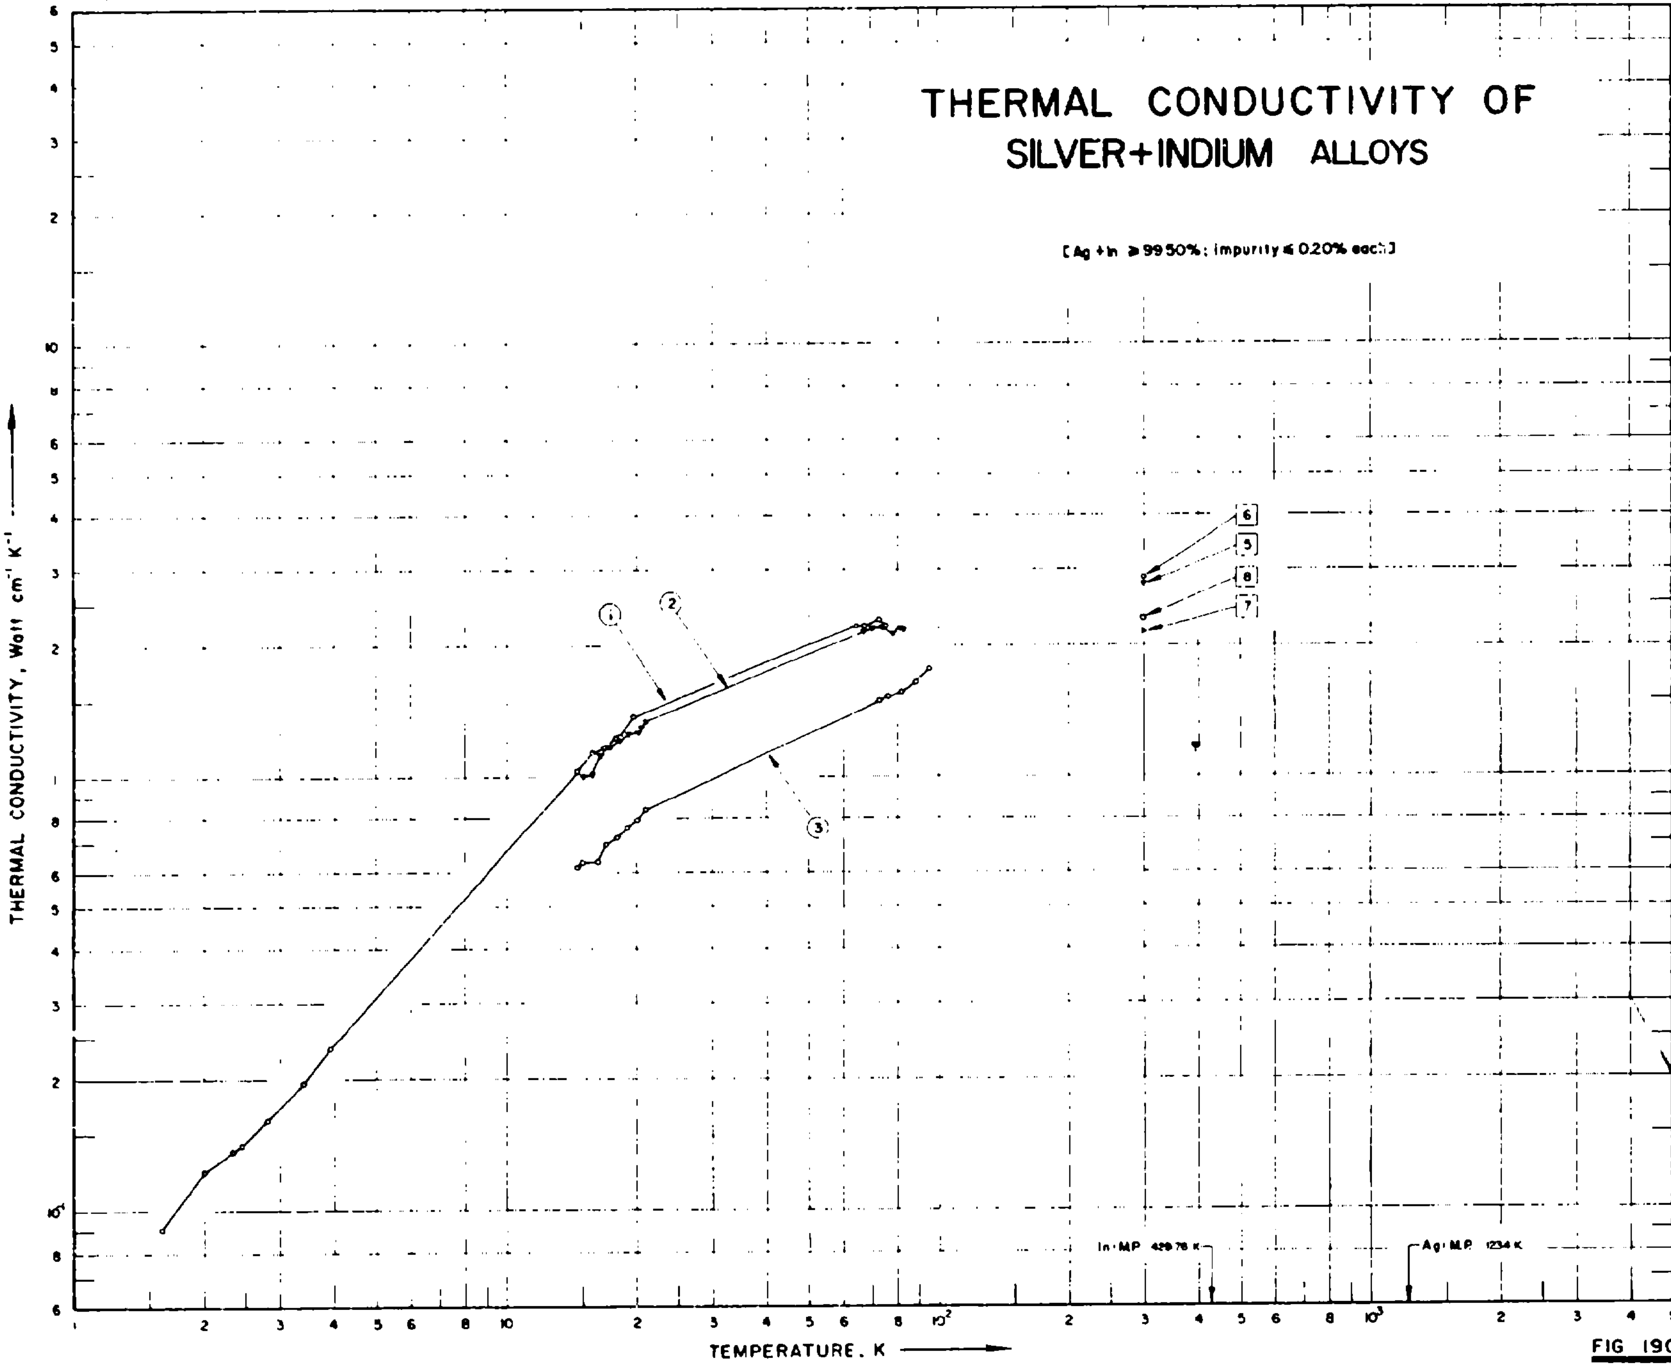

FIG 190

SPECIFICATION TABLE NO. 190 THERMAL CONDUCTIVITY OF SILVER + INDIUM ALLOYS

(Ag + In > 99.50%, impurity < 0.20% each)

[For Data Reported in Figure and Table No. 190]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ag	In	Composition (continued), Specifications and Remarks
1	22	L	1959	1.6-76			99.75	0.25	Calculated composition; polycrystalline specimen ~6 cm long; ρ_0 = 0.45 μohm cm (same as the succeeding specimen, Ag - In 1).
2	51	L	1956	15-8[illegible]		Ag - In 1	99.75	0.25	Calculated composition, prepared from Ag (pure, supplied by Nordiska Affiveriet) and In (< 0.00005 impurity); annealed in vacuo at 720 C; electrical resistivity ranging from 0.425 to 1.89 μohm cm at 14 to 273 K, respectively.
3	51	L	1956	15-95		Ag - In 2	99.45	0.55	Similar to the above specimen except electrical resistivity ranging from 0.895 to 2.395 μohm cm at 14 to 273 K, respectively.
4	904	C	1962	298.2			99.0	1.0	Cast; copper used as comparative material.
5	904	C	1962	298.2			98.0	2.0	Cast; copper used as comparative material.
6	904	C	1962	298.2			97.0	3.0	Cast; copper used as comparative material.
7	904	C	1962	298.2			96.0	4.0	Cast; copper used as comparative material.
8	904	C	1962	298.2			95.0	5.0	Cast; copper used as comparative material.

SPECIFICATION TABLE NO. 191 THERMAL CONDUCTIVITY OF (SILVER + LEAD) ALLOYS

(Ag + Pb ≥ 99.50%, impurity ≤ 0.20% each)

For Data Reported in Figure and Table No. 191

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Ag	Pb	Composition (continued), Specifications and Remarks
1	51	L	1956	15-86		Ag-Pb 1	99.75	0.25	Calculated composition, prepared from Ag (pure, supplied by Nordiska Affiveriet) and Pb (< 0.00005 impurity); annealed in vacuo at 720 C; electrical resistivity ranging from 0.637 to 2.07 μohm cm at 14 to 273 K, respectively.
2	51	L	1956	15-83		Ag-Pb 2	99.62	0.38	Similar to the above specimen but quenched in water; electrical resistivity 0.983 to 2.47 μohm cm at 14 to 273 K, respectively.
3	230	L	1925	333			90	10	Prepared by fusing Ag (99.9 pure) and Pb (< 0.03 impurities, supplied by Baker); specimen ~5.5 cm long, 0.3 cm^2 cross-sectional area, electrical conductivity 12.17 x 10^4 ohm^{-1} cm^{-1} at 25 C.
4	230	L	1925	333			80	20	Similar to the above specimen except electrical conductivity 9.43 x 10^4 ohm^{-1} cm^{-1} at 25 C.
5	230	L	1925	333			70	30	Similar to the above specimen except electrical conductivity 7.14 x 10^4 ohm^{-1} cm^{-1} at 25 C.
6	230	L	1925	333			60	40	Similar to the above specimen except electrical conductivity 6.90 x 10^4 ohm^{-1} cm^{-1} at 25 C.
7	230	L	1925	333			50	50	Similar to the above specimen except electrical conductivity 6.15 x 10^4 ohm^{-1} cm^{-1} at 25 C.

[For Data Reported in Figure and Table No. 214]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sn	In	Composition (continued), Specifications and Remarks
1	452	L	1955	0.5-4.2	2-4	Sn 7 JM 4600 + In	99.65	0.35	Cast; single crystal with tetragonal axis 82° to rod axis; in superconducting state.
2	452	L	1955	1.3-2.1	2-4	Sn 7 JM 4600 + In	99.65	0.35	The above specimen measured in a longitudinal field of 400 gauss; in normal state.
3	452	L	1955	0.35-2.1	2-4	Sn 8 JM 4600 + In	96.9	3.1	Cast; single crystal with tetragonal axis 73° to rod axis; measured in a longitudinal field of 450 gauss; in normal state.
4	452	L	1955	1.6-2.0	2-4	Sn 8 JM 4600 + In	96.9	3.1	The above specimen measured after switching off the magnetic field.
5	452	L	1955	0.31-0.91	2-4	Sn 8 JM 4600 + In	96.9	3.1	The above specimen measured in a longitudinal field of 300 gauss; in normal state.
6	452	L	1955	0.22-4.0	2-4	Sn 8 JM 4600 + In	96.9	3.1	The above specimen in superconducting state.
7	452	L	1955	0.36-1.1	2-4	Sn 8 JM 4600 + In	96.9	3.1	The above specimen annealed at 210 C for 14 days; in superconducting state.
8	452	L	1955	0.45-1.3	2-4	Sn 9 JM 4600 + In	96.9	3.1	Polycrystal; grain size about 0.3 mm; cast, strained and annealed for 17 days; in superconducting state.
9	453	L	1958	2.0-21	< 1.0	Sn 2	97.98	2.02	Prepared from spectroscopically pure Sn and 99.9 pure In; single crystal; angle between tetragonal axis and specimen axis (orientation) ≈ 90°.
10	453	L	1958	3.8-21	< 1.0	Sn 2'	97.98	2.02	Similar to the above specimen except orientation ≈ 77°; in normal state.
11	453	L	1958	2.0-21	< 1.0	Sn 2.1	97.89	2.11	Similar to the above specimen except orientation ≈ 70°; in normal state.
12	453	L	1958	2.0-21	< 1.0	Sn 2.5	97.55	2.45	Similar to the above specimen except orientation ≈ 85°; in normal state.
13	453	L	1958	2.0-21	< 1.0	Sn 2.8	97.16	2.84	Prepared from spectroscopically pure Sn and 99.9 pure In; single crystal with about 5% of volume being inclusions of foreign orientation; orientation ≈ 78°; in normal state.
14	453	L	1958	2.0-22	< 1.0	Sn 4	96.04	3.96	Prepared from spectroscopically pure Sn and 99.9 pure In; coarse polycrystal with grain size about 2-3 mm; in normal state.
15	453	L	1958	1.8-21	< 1.0	Sn 5	95.03	4.97	Similar to the above specimen.

SPECIFICATION TABLE NO. 213 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sn	In	Composition (continued), Specifications and Remarks
16	453	L	1958	2.0-21	1.0	Sn 5.[illegible]	94.35	5.65	Similar to the above specimen.
17	453	L	1958	2.0-21	1.0	Sn 8.2	91.8	8.2	Prepared from spectroscopically pure Sn and 99.9 pure In; fine grained polycrystal; in normal state.
18	454	L	1958	0.37-0.90	2.0	B 6	97.0	3.0	Specimen 1.48 mm in diameter; cast; homogenized by annealing in vacuo for 2 weeks at 320 C; electro polished; angle between tetrad axis and specimen axis = 80°; surface roughness 0.09 μ.
19	454	L	1958	0.40-1.0	2.0	B 4	97.0	3.0	Similar to the above specimen except the diameter 0.875 mm and surface roughness 0.15 μ.
20	454	L	1958	0.39-1.0	2.0	B 1	97.0	3.0	Similar to the above specimen except the diameter 1.48 mm, surface roughness 1.0 μ; etched.
21	454	L	1958	0.39-1.2	2.0	B 5	97.0	3.0	Similar to the above specimen except the diameter; 0.875 mm.
22	455	L	1953	0.23-1.2	10-25	Sn IX	97	3	Specimen 2.8 mm in diameter; polycrystal; cast in tube; crystals size of the order of the diameter; in superconducting state.
23	455	L	1953	0.18-0.67	10-25	Sn X	97	3	Similar to the above specimen except the size of crystals being a fraction of the diameter.
24	455	L	1953	0.15-1.2	10-25	Sn IV	99.7	0.[illegible]	Similar to the above specimen except crystals size of the order of the diameter.
25	456	L	1958	2.3-4.2	2	3	97.0	3.0	Specimen annealed for several months; measured in a longitudinal magnetic field of about 560 gauss; in normal state.

THERMAL CONDUCTIVITY OF
TIN + LEAD ALLOYS
(Sn + Pb ≥ 99.50%; impurity ≤ 0.20% each)
THERMAL CONDUCTIVITY, Watt cm⁻¹ K⁻¹
TEMPERATURE, K
Sn.TP (s.c.) 1722 K
Pb:TP 7.193 K
Sn M.P. 505.06 K
Pb M.P. 600.4 K

FIG. 215

SPECIFICATION TABLE NO. 215 THERMAL CONDUCTIVITY OF (TIN + LEAD) ALLOYS

(Sn + Pb ≥ 99.50%; impurity < 0.20% each)

[For Data Reported in Figure and Table No. 215]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sn	Pb	Composition (continued), Specifications and Remarks
1	230	L	1925	327.2			50	50	Approx. composition: < 0.03 total impurity in each metal; specimen 1.9 cm in dia and 10 cm long; supplied by Baker; electrical conductivity 6.47×10^4 ohm^{-1} cm^{-1} at 22 C.
2	230	L	1925	327.2			60	40	Similar to the above specimen except electrical conductivity 6.92×10^4 $ohm^{-1} cm^{-1}$ at 22 C.
3	230	L	1925	327.2			80	20	Similar to the above specimen except electrical conductivity 7.62×10^4 $ohm^{-1} cm^{-1}$ at 22 C.
4	19	L	1923	313-693			62	3[illegible]	Specimen 1.5 cm in dia and 12 cm long; melting point 180 C.
5	229	L	1955	2.0-90		Soft solder	60	40	No other details reported.
6	837	L	1967	1.5-4.6	1	Pb 3	98.30	1.70	Prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Pb, extruding into 1.5 mm dia wire, annealed at ~200 C for several days; electrical resistivity 0.00478 and 13.55 μohm cm at 4.2 and 273 K, respectively. T_c 3.752 K; normal-state data were taken at temperatures below T_c with a longitudinal magnetic field applied to the sample.
7	837	L	1967	1.3-3.6	1	Pb 3	98.30	1.70	Same as the above specimen, except the magnetic field was removed so the superconducting-state data were taken.
8	836	L	1958	1.6-4.4	4-5	7	99.54	0.46	Prepared by vacuum-melting appropriate amounts of Johnson-Matthey 99.999 pure Sn and Pb, casting into 1 mm dia x 12 cm long wire with pyrex capillary; electrical resistivity 0.112 μohm cm; a magnetic field was applied when taking normal-state data at temperatures below T_c.
9	836	L	1958	1.6-3.3	4-5	7	99.54	0.46	Same as the above specimen except the magnetic field was removed so the superconducting-state data were taken.

SPECIFICATION TABLE NO. 330 THERMAL CONDUCTIVITY OF [IRON + CHROMIUM + NICKEL + ΣX_i] ALLOYS GROUP I

(X_i < 0.20% except C < 2.00% and Mn, P, S, Si < 0.60% each)

[For Data Reported in Figure and Table No. 330]

Curve No.	Ref. No.	Method Used	Year	Temperature Range, K	Reported Error, %	Name and Specimen Designation	Cr	Ni	C	Mn	Si	Composition (continued), Specifications and Remarks
1	157	L	1939	1.8- 93		3754	18.8	8.10	0.12	0.24	0.43	Quenched in water from 1150 C.
2	158	L	1955	406-1008		AISI 304 stainless	17.0/ 19.0	7.0/ 9.0	0.11			Nominal composition.
3	159	L	1952	23, 79	< 10.0	AISI 304 stainless	17.0/ 19.0	7.0/ 9.0	0.11			Nominal composition.
4	129	C	1933	373- 788	3.0-5.0	A7	18.6	9.10	0.07	0.27		Heated to 735 C for 8 hrs and cooled in diatomaceous earth.
5	129	C	1933	373- 773	3.0-5.0	A8	18.5	9.23	0.11	0.19		Heated to 1120 C and quenched in cold water.
6	129	C	1933	373- 773	3.0-5.0	A9	19.6	8.96	0.24	0.37		Heated to 735 C for 8 hrs and cooled in diatomaceous earth.
7	129	C	1933	355- 773	3.0-5.0	A10	19.6	7.99	0.24	0.28		Heated to 1120 C and quenched in water.
8	161	C	1934	373- 773	2.0	A10A	19.6	7.99	0.24	0.28		The above specimen A10 heated again for 8 hrs at 735 C and cooled in furnace.
9	152	L	1949	10- 20		Stainless						Composition unknown.
10	160	F	1938	373- 773		AS21	27.0	18.0	0.32			Quenched
11	162	C	1936	273-1073		Staybrite	17.87	8.04	0.15	0.26	0.19	Softened at 1150 to 1200 C.
12	163	L	1936	303-1373		12	17.50	8.85	0.11	0.53	0.48	Rolled.
13	163	L	1936	303-1173		14	24.50	4.22	0.19	0.51	0.50	Rolled.
14	131	C	1953	323-1173	2.0	AISI 302 stainless	18.40	9.66	0.116		0.130	71.60 Fe, 0.021 P, 0.013 S, annealed at 1100 C.
15	129	C	1933	373- 773	3.0-5.0	A3	14.60	0.70	0.14	0.19	0.12	0.020 P, 0.015 S; annealed at 845 C.
16	162	C	1936	273-1073		F. H. stainless	13.65	0.37	0.27	0.29	0.27	Air hardened from 940 C and tempered at 725 C.
17	163	L	1936	303-1373		11	13.30	0.50	0.16	0.46	0.26	Rolled.
18	104	L	1951	15- 93		3754	18.80	8.10	0.12	0.24	0.43	Heated to 1150 C and quenched in oil.
19	539	L	1938	336-1056			17.30	8.61	0.26	0.30	0.20	0.017 P, 0.002 S; heated at 1100 C and quenched in water.
20	539	L	1938	326- 579			17.30	8.61	0.26	0.30	0.20	0.017 P, 0.002 S; heated at 1180 C and quenched in water.
21	539	L	1938	344-1052			17.30	8.61	0.26	0.30	0.20	0.017 P, 0.002 S; heated at 1180 C and quenched in water, then reheated to 306 C.
22	539	L	1938	348-1069			13.29	0.51	0.12	0.33	0.19	0.017 P, 0.016 S, annealed at 900 C and furnace cooled.
23	539	L	1938	331- 584			13.29	0.51	0.12	0.33	0.19	0.017 P, 0.016 S, water-quenched from 1180 C.
24	539	L	1938	340-1074			13.29	0.51	0.12	0.33	0.19	0.017 P, 0.016 S, water-quenched from 1180 C, and reheated to 310 C.
25	563	L	1935	273, 1273		Russian stainless	18.9	7.5	0.20	0.47	0.11	0.022 P.
26	565	L	1949	27- 250		18-8 type 304 stainless						Nominal composition.

90	986, 987	E	1963	399-671	<3	R15Kh3										Same composition and heat treatment as the above specimen.
91	986, 987	E	1963	316-909	<3	R15Kh3K5	15.13	0.85	2.96							5.05 Co, 1.40 V; quenched at 1250 C, tempered at 580 C.
92	986, 987	E	1962	305-783	<3	R15Kh3K5										Similar to the above specimen.
93	986, 987	E	1963	323-877	<3	R15Kh3K10	15.16	0.78	2.85							9.50 Co, 1.45 V; quenched at 1250 C, tempered at 580 C.
94	986, 987	E	1963	330-995	<3	R15Kh3K12	14.90	0.77	3.3							11.74 Co, 1.59 V; quenched at 1250 C, tempered at 580 C; measured during heating.

SPECIFICATION TABLE NO. 346 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	W	C	Cr	Cu	Mn	Mo	P	S	Si	Composition (continued), Specifications and Remarks
95	986, 987	E	1963	417-995	<3	R15Kh3K12										The above specimen measured during cooling.
96	986, 987	E	1963	348-840	<3	R15Kh3K12										Same composition and heat treatment as the above specimen.
97	986, 987	E	1963	361-974	<3	R15Kh4	14.76	0.83	4.13							1.59 V; Quenched at 1250 C, tempered three times at 560 C; electrical resistivity 1.93, 1.80, 1.66, 1.57, 1.40, 1.29, 1.18, 1.10, 1.01, and 0.972 x 10^{-4} ohm^{-1} cm^{-1} at 38, 91, 153, 200, 306, 381, 450, 515, 569, and 649 C, respectively.
98	986, 987	E	1963	314-753	<3	R7	7.94	0.79	4.10							1.69 V; quenched at 1200 C, tempered three times at 560 C; electrical resistivity 2.14, 1.82, 1.68, 1.23, and 1.22 x 10^{-4} ohm^{-1} cm^{-1} at 39, 153, 215, 481, and 508 C, respectively.
99	986, 987	E	1963	309-794	<3	R10	9.52	0.81	4.28							1.40 V; quenched at 1220 C, tempered three times at 560 C; electrical resistivity 2.08, 1.82, 1.57, 1.39, 1.22, and 1.23 x 10^{-4} ohm^{-1} cm^{-1} 46, 141, 249, 337, 457, and 523 C, respectively.
100	986, 987	E	1963	308-790	<3	R12	12.25	0.84	4.13							1.55 V; quenched at 1240 C, tempered three times at 560 C; electrical resistivity 2.13, 1.71, 1.47, and 1.15 x 10^{-4} ohm^{-1} cm^{-1} at 39, 214, 318, and 525 C, respectively.
101	986, 987	E	1963	311-668	<3	R18	18.80	0.75	3.98							1.09 V; quenched at 1280 C, tempered three times at 560 C; electrical resistivity 1.85, 1.73, 1.44, and 1.21 x 10^{-4} ohm^{-1} cm^{-1} at 43, 97, 243, and 400 C, respectively.

DATA TABLE NO. 346 THERMAL CONDUCTIVITY OF (IRON + TUNGSTEN + ΣX_i) ALLOYS GROUP II

(At least one X_i [illegible] 0% or if any of Mn, P, S, Si > 0.60%)

[Temperature, T, K; Thermal Conductivity, k, Watts cm^{-1}K^{-1}]

SPECIFICATION TABLE NO. 347 THERMAL CONDUCTIVITY OF Sb_2Te_3 INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 347]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	521	C	1957	300		Sb_2Te_3	p-type, excess Sb; rhombohedral crystal; hole concentration 70 x 10^{18} cm^{-3}; prepared by sintering, annealing, and crystallizing by Bridgeman technique.
2	585	L	1961	293-363		Sb_2Te_3	Polycrystal; cylindrical specimen; current carriers 10^{20} cm^{-3}.
3	832		1962	303.2		Sb_2Te_3	p-type; prepared from 99.99$^+$ pure elements by cold-pressing -60 mesh powder at 35 tsi and sintering at 450 C for 3 hrs in Argon; heat flow perpendicular to pressing direction; electrical resistivity 0.78 x 10^{-3} ohm cm and 1.09 x 10^{-3} ohm cm at 100-400 C and 150-450 C, respectively.
4	833		1962	303.2		Sb_2Te_3	p-type; prepared from 99.99$^+$ pure elements by cold-pressing -60 mesh powder at 35 tsi and sintering at 500 C for 3 hrs in Argon; heat flow perpendicular to pressing direction; electrical resistivity 0.21 x 10^{-3} ohm cm and 0.61 x 10^{-3} ohm cm at 30 C and 150-450 C, respectively.
5	936	T	1965	298.2		Sb_2Te_3	2.58 Te excess (calculated); p-type; 0.5 x 0.5 x 1 cm; prepared from 99.999 Sb supplied by Consolidated Mining and Smelting Co., and from 99.97 Te, supplied by Canadian Copper Refiners, Ltd., materials weighed out, crushed, sealed in an ampule in a vacuum of 10^{-5} Torr, heated at 900 C for 20 hrs, rocked, cooled, zone-melted at a rate of 0.07-0.28 in. hr^{-1}, then cooled and cut; thermal conductivity data calculated from measured values of figure of merit, Seebeck coefficient, and electrical conductivity; electrical conductivity reported as 4.33 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
6	936	T	1965	298.2		Sb_2Te_3	Cut from the same ingot as the above specimen; electrical conductivity reported as 4.33 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.

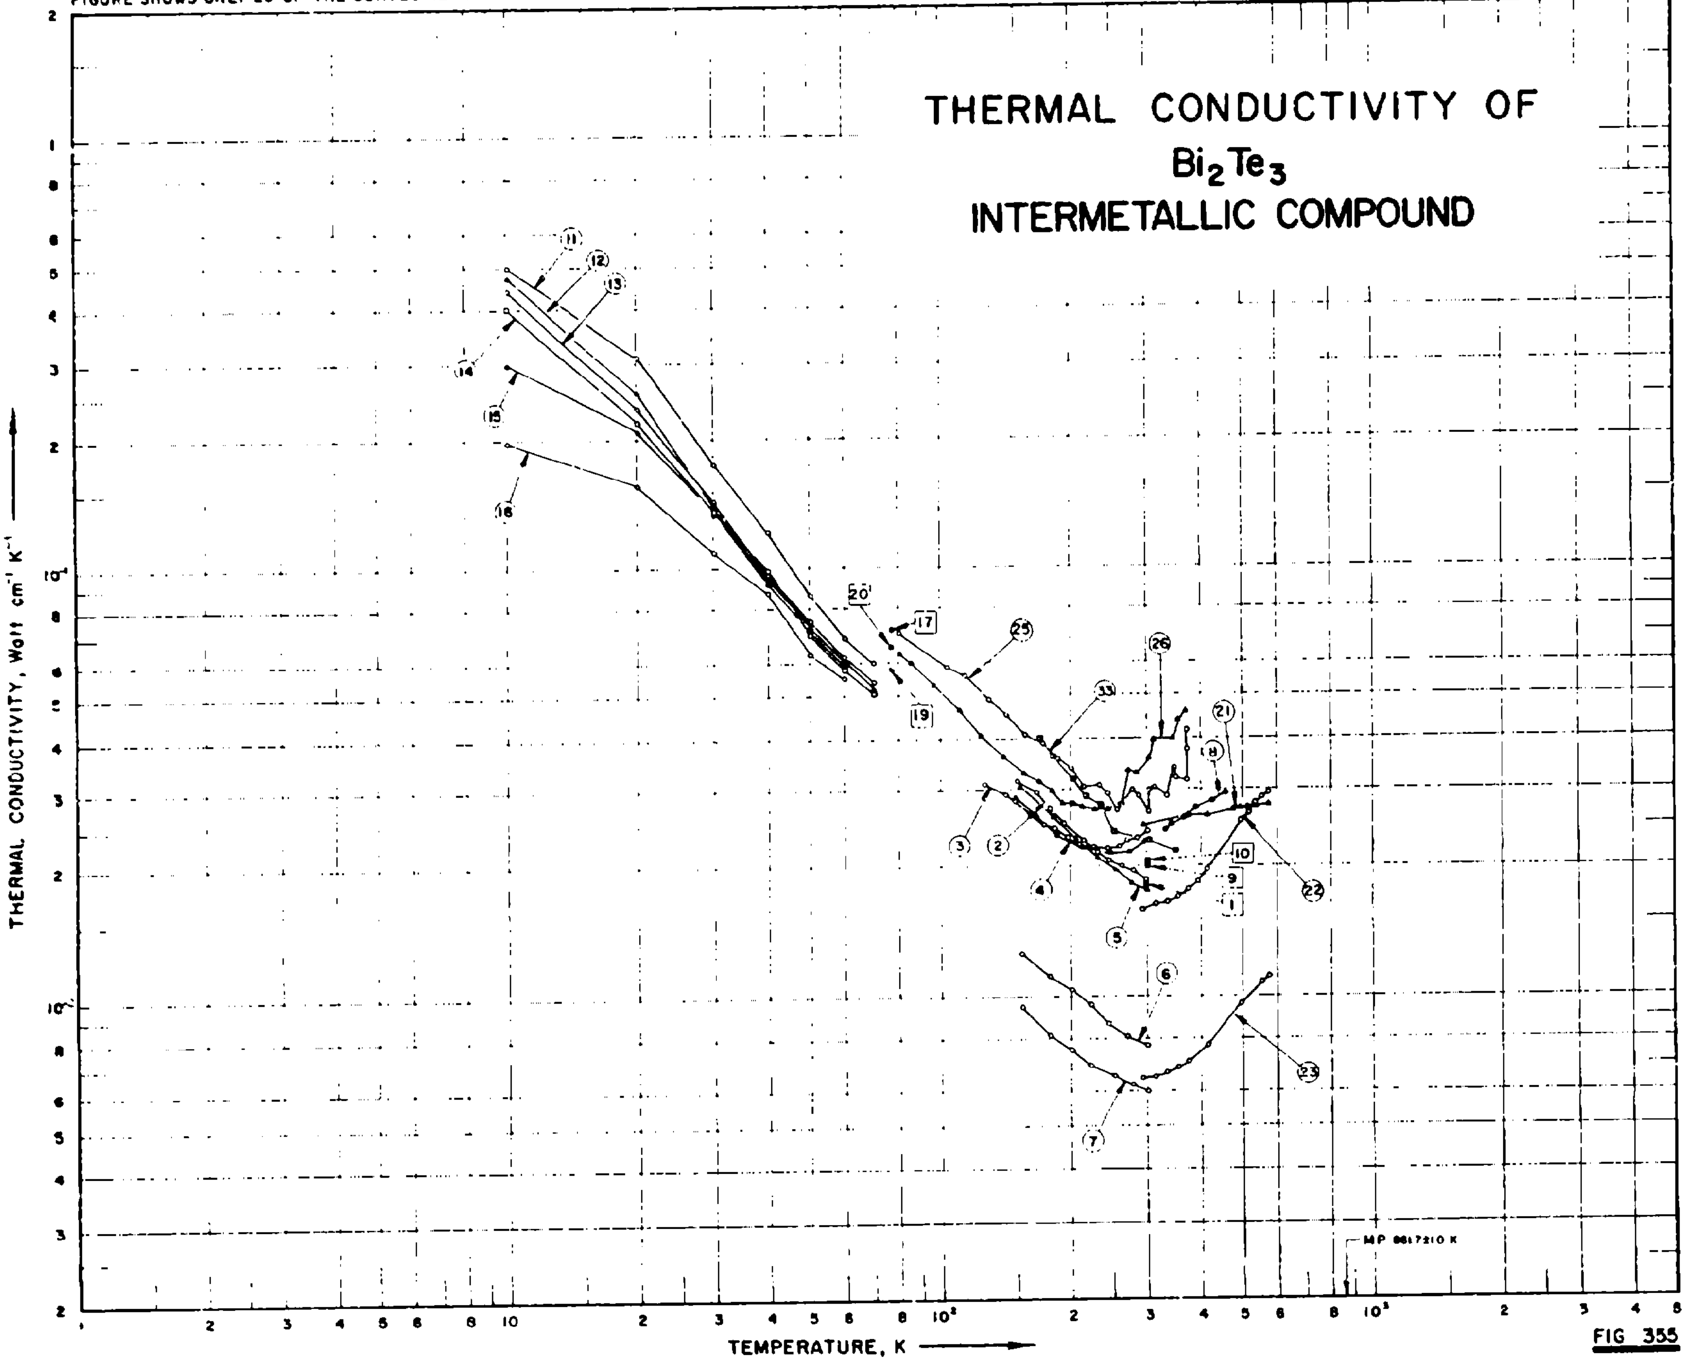

FIG 355

SPECIFICATION TABLE NO. 355 THERMAL CONDUCTIVITY OF Bi_2Te_3 INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 355]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	368	L, C	1954	298.2	0.2-3.0	Bi_2Te_3	Fine crystalline structure; extruded; current carriers 6.8×10^{18} cm^{-3}; 15 mm dia, 1 to 3 mm thick; electrical conductivity 1500 ohm^{-1} cm^{-1} at 25 C.
2	332	L	1956	150-300	~2	Bi_2Te_3, No. 1	n-type; cut from impure end of zone refined bar; rectangular specimen; heat flow parallel to zoning direction and the cleavage plane; electrical conductivity 750 ohm^{-1} cm^{-1} at room temperature.
3	332	L	1956	127-300	~2	Bi_2Te_3, No. 2	n-type; intrinsic; zone refined; rectangular specimen; cut from the same bar as the above specimen; heat flow and zoning direction parallel to the cleavage plane; electrical conductivity 200 ohm^{-1} cm^{-1} at room temperature.
4	332	L	1956	150-293	~2	Bi_2Te_3, No. 3	Similar to the above specimen (adjacent specimen).
5	332	L	1956	152-300	~2	Bi_2Te_3, No. 4	p-type single crystal; heat flow parallel to the cleavage plane; electrical conductivity 500 ohm^{-1} cm^{-1} at room temperature.
6	332	L	1956	154-300	~2	Bi_2Te_3, No. 5	p-type single crystal; heat flow perpendicular to the cleavage plane; elctrical conductivity 500 ohm^{-1} cm^{-1} at room temperature.
7	332	L	1956	154-390	~2	Bi_2Te_3, No. 6	Similar to the above specimen.
8	326	C	1960	333-457		Bi_2Te_3	p-type polycrystalline specimen; prepared from Asarco 99.999+ pure Bi and 99.999+ Te; prepared by fusing in vacuo; hexagonal unit cell with constants of: a = 4.37 Å and c = 30.62 Å; specimen 12 mm dia and 6 mm thick; electrical conductivity ~10^3 ohm^{-1} cm^{-1}; Armco iron used as reference; measured in vacuo of ~10^{-6} mm Hg.
9	325	T	1959	300	1	Bi_2Te_3; 30	p-type; electrical resistivity 1.90×10^{-3} ohm cm.
10	325	T	1959	300	1	Bi_2Te_3; 17a	p-type; electrical resistivity 1.07×10^{-3} ohm cm.
11	311	L	1960	10-70	5	Bi_2Te_3; SBTC 18	p-type single crystal; form factor (F = length/cross-sectional area) = 30.4; measured in a vacuo of < 5×10^{-5} mm Hg.
12	311	L	1960	10-70	5	Bi_2Te_3; SBTC 19	p-type single crystal; doped with I, final concentration 0.027; F = 25.3; measured in a vacuum of < 5×10^{-5} mm Hg.
13	311	L	1960	10-70	5	Bi_2Te_3; SBTC 27	n-type single crystal; doped with I, final concentration 0.037; F = 30.0; measured in a vacuum of < 5×10^{-5} mm Hg.
14	311	L	1960	10-70	5	Bi_2Te_3; SBTC 16	n-type single crystal; doped with I, final concentration 0.046; F = 24.0; measured in a vacuum of < 5×10^{-5} mm Hg.
15	311	L	1960	10-60	5	Bi_2Te_3; SBTC 15	n-type single crystal; doped with I, final concentration 0.059; F = 52.8; measured in a vacuum of < 5×10^{-5} mm Hg.
16	311	L	1960	10-60	5	Bi_2Te_3; SBTC 10	n-type single crystal; doped with I, final concentration 0.124; F = 34.0; measured in a vacuum of < 5×10^{-5} mm Hg.
17	386	L	1958	77		Bi_2Te_3, S 22	p-type single crystal; undoped; measured in a magnetic field parallel to the crystal axis; heat flow perpendicular to the crystal axis.

SPECIFICATION TABLE NO. 355 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
18	386	L	1958	77		Bi_2Te_3; S 21	Similar to the above specimen.
19	386	L	1958	77		Bi_2Te_3; S 17	n-type single crystal; doped with 0.055 I (nominal); magnetic field parallel to the crystal axis, heat flow perpendicular to the crystal axis.
20	386	L	1958	77		Bi_2Te_3; S 15	Similar to the above specimen except doped with 0.09 I.
21	387	P	1960	293-573	±20	Bi_2Te_3; 68	p-type; measured in a 1.95 MEV electron beam; heat flow parallel to crystal planes; electrical resistivity ~5.1 x 10^{-4} ohm cm at room temperature.
22	387	P	1960	293-573	±20	Bi_2Te_3; 64	p-type; measured in a 1.95 MEV electron beam; heat flow perpendicular to the crystal planes; ρ ~ 9.6 x 10^{-4} ohm cm at room temperature.
23	387	P	1960	293-573	±20	Bi_2Te_3; 59	Similar to the above specimen except ρ ~ 13.8 x 10^{-4} ohm cm at room temperature.
24	387	P	1960	293-573	±20	Bi_2Te_3; 69	n-type; measured in a 1.95 MEV electron beam; heat flow perpendicular to the crystal planes; ρ ~ 6.5 x 10^{-4} ohm cm at room temperature.
25	388	L	1957	80-370		Bi_2Te_3	p-type single crystal; specimen 0.5 x 0.5 x 2.5 cm, prepared by zone melting from Bi (99.999 pure, supplied by Cerro de Paco Corp.) and Te (99.999 pure, supplied by American Smelting and Refining Co.); 2 x 10^{19} excess holes cm^{-3}.
26	388	L	1957	80-370		Bi_2Te_3; D-13	n-type single crystal; specimen 0.5 x 0.5 x 2.5 cm, prepared from Bi (99.999 pure, supplied by Cerro de Paco Corp.) and Te (99.999 pure, supplied by American Smelting and Refining Co.); 3 x 10^{17} excess electrons cm^{-3}.
27	549	L	1959	311.2	±10	Bi_2Te_3	Supplied by Electronic System Laboratory, M.I.T.
28	521	C	1957	300		Bi_2Te_3	n-type (excess Te, I); electron concentration 5 x 10^{18} cm^{-3} at 300 K; rhombohedral structure (a_0 = 10.45 Å and α = 24° 8'); prepared by zone melting, quenching and annealing.
29	521	C	1957	300		Bi_2Te_3	p-type (excess Bi, Pb); hole concentration 8 x 10^{18} cm^{-3} at 300 K; structure and specimen similar to the above.
30	386	L	1958	77		Bi_2Te_3; S 11	n-type single crystal; doped with (nominal) 0.40 I; heat flow perpendicular to the crystal axis, a magnetic field parallel to the crystal axis.
31	936	T	1965	298.2		Bi_2Te_3	2.03 Te excess (calculated); n-type, 0.5 x 0.5 x 1 cm; prepared from 99.999 pure Bi supplied by Consolidated Mining and Smelting Co. and from 99.9+ pure Te supplied by Canadian Copper Refiners, Ltd., materials weighed out, crushed, sealed in an ampule in a vacuum of 10^{-5} Torr, heated at 900 C for 20 hrs, rocked, cooled, zone-melted at a rate of 0.07 - 0.28 in. hr^{-1}, then cooled and cut; thermal conductivity data calculated from measured values of figure of merit, Seebeck coefficient, and electrical conductivity; electrical conductivity reported as 1.78 x 10^3 ohm^{-1} cm^{-1} at room temperature.
32	936	T	1965	298.2		Bi_2Te_3	Cut from the same ingot as the above specimen; electrical conductivity reported as 1.75 x 10^3 ohm^{-1} cm^{-1} at room temperature.
33	936	T	1965	170-351		Bi_2Te_3	Similar to the above specimen except electrical resistivity reported as 244, 267, 309, 360, 389, 454, 517, 582, and 721 μohm cm at 171, 183, 203, 219, 239, 256, 281, 304, and 350 K, respectively.

SPECIFICATION TABLE NO. 355 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
34	936	T	1965	298.2		Bi_2Te_3	Similar to the above specimen except electrical conductivity reported as 1.29×10^3 ohm^{-1} cm^{-1} at room temperature.
35	936	T	1965	298.2		$Bi_2Te_{3.06}$	0.95 Te excess (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.24×10^3 ohm^{-1} cm^{-1} at room temperature.

FIG 357

SPECIFICATION TABLE NO. 357 THERMAL CONDUCTIVITY OF CdSb INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 357]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	823		1963	130-350		CdSb	No details reported.
2	824	L	1962	85-410		CdSb, No. 1	p-type; polycrystalline specimen; electrical conductivity 0.6 $ohm^{-1} cm^{-1}$ at room temperature.
3	824	L	1962	110-395		CdSb, No. 2	p-type; single crystal grown by zone recrystallization; electrical conductivity 0.71 $ohm^{-1} cm^{-1}$ at room temperature; heat flow normal to the [112] plane of the crystal.
4	824	L	1962	95-415		CdSb, No. 3	As above but the electrical conductivity, 0.68 $ohm^{-1} cm^{-1}$ at room temperature.
5	824	L	1962	220-395		CdSb, No. 4	As above but the electrical conductivity, 0.54 $ohm^{-1} cm^{-1}$ at room temperature.
6	940, 941	L	1964	113-491		CdSb, 1	p-type single crystal; high purity Cd and Sb obtained by triple vacuum fractional distillation followed by zone refining, specimen ingot grown by the zone recrystallization method; measured in a vacuum of 10^{-3} - 10^{-4} mm Hg; heat flow parallel to the [100] direction.
7	940, 941	L	1964	112-406		CdSb; 2	Cut from the same ingot as the above specimen; heat flow parallel to the [010] direction.
8	940, 941	L	1964	107-408		CdSb, 3	Cut from the same ingot as the above specimen; heat flow parallel to the [001] direction.
9	940, 941	L	1964	106-413		CdSb; 4	Similar to the above specimen, heat flow parallel to the [100] direction.
10	940, 941	L	1964	106-391		CdSb, 5	Cut from the same ingot as the above specimen, heat flow parallel to the [010] direction.
11	940, 941	L	1964	106-411		CdSb; 6	Cut from the same ingot as the above specimen; heat flow parallel to the [001] direction.

SPECIFICATION TABLE NO. 357 THERMAL CONDUCTIVITY OF CdSb INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 357]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	823		1963	130-350		CdSb	No details reported.
2	824	L	1962	85-410		CdSb, No. 1	p-type; polycrystalline specimen; electrical conductivity 0.6 ohm^{-1} cm^{-1} at room temperature.
3	824	L	1962	110-395		CdSb, No. 2	p-type; single crystal grown by zone recrystallization; electrical conductivity 0.71 ohm^{-1} cm^{-1} at room temperature; heat flow normal to the [112] plane of the crystal.
4	824	L	1962	95-415		CdSb, No. 3	As above but the electrical conductivity, 0.68 ohm^{-1} cm^{-1} at room temperature.
5	824	L	1962	220-395		CdSb, No. 4	As above but the electrical conductivity, 0.54 ohm^{-1} cm^{-1} at room temperature.
6	940, 941	L	1964	113-401		CdSb; 1	p-type single crystal; high purity Cd and Sb obtained by triple vacuum fractional distillation followed by zone refining, specimen ingot grown by the zone recrystallization method; measured in a vacuum of 10^{-3} - 10^{-4} mm Hg; heat flow parallel to the [100] direction.
7	940, 941	L	1964	112-406		CdSb; 2	Cut from the same ingot as the above specimen; heat flow parallel to the [010] direction.
8	940, 941	L	1964	107-408		CdSb; 3	Cut from the same ingot as the above specimen; heat flow parallel to the [001] direction.
9	940, 941	L	1964	106-413		CdSb; 4	Similar to the above specimen; heat flow parallel to the [100] di[illegible]
10	940, 941	L	1964	106-391		CdSb; 5	Cut from the same ingot as the above specimen; heat flow [illegible] the [010] direction.
11	940, 941	L	1964	106-411		CdSb; 6	Cut from the same ingot as the above specimen; heat flow parallel to the [001] direction.

SPECIFICATION TABLE NO. 358 THERMAL CONDUCTIVITY OF CdTe INTERMETALLIC COMPOUNDS

[*For Data Reported in Figure and Table No.* 358]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	*Name and* Specimen Designation	Composition (weight percent), *Specifications and Remarks*
1	942	L	1965	240-449	7	CdTe; 3.2	Stoichiometric single crystal, p-type; prepared by melting 99.999 pure Te and Cd, mixed in a 5 ~ 6 mm dia quartz phial with 1 mm dia x 15 mm long capillary extended at bottom end annealed at 1150 C for 48 hrs; electrical resistivity reported at 228 ~ 485 K was 17.9 x 10^4 ~ 123 ohm cm; measured in a vacuum of 10^{-4} Torr.
2	942	L	1965	124-451	7	CdTe; 7	Stoichiometric polycrystalline, p-type; same production method and measuring condition as the above specimen, electrical resistivity reported as 589 ~ 479 ohm cm at 134 ~ 485 K.
3	942	L	1965	168-449	7	CdTe; 6	Single crystal, p-type; same production method and measuring condition as the above specimen; electrical resistivity reported as 41.3 x 10^3 ~ 92.1 ohm cm at 166 ~ 483 K.
4	942	L	1965	148-436	7	CdTe; 9	Similar to the above specimen except electrical resistivity reported as 45.5 x 10^4 ~ 0.273 x 10^4 ohm cm at 167 ~ 441 K.
5	942	L	1965	189-443	7	CdTe; 8.2	p-type single crystal; same production method and measuring condition as the above specimen; electrical resistivity reported as 1.8 x 10^4 ~ 337 ohm cm at 190 ~ 444 K.
6	942	L	1965	348-441	7	CdTe; 10.2	Similar to the above specimen except electrical resistivity reported as 42.7 x 10^4 ~ 1.18 x 10^4 ohm cm at 346 ~ 433 K.
7	94	L	1963	297-450		CdTe	p-type; specimen 8 mm in dia, 12-14 mm long; synthesized in evacuated quartz ampule at 10^{-3} mm Hg, heated to above the melting point of the component with higher melting point for 2 hrs, then heated to the melting point of the compound for 8 hrs; annealed at 700-800 C for several hrs and then cooled to room temperature.

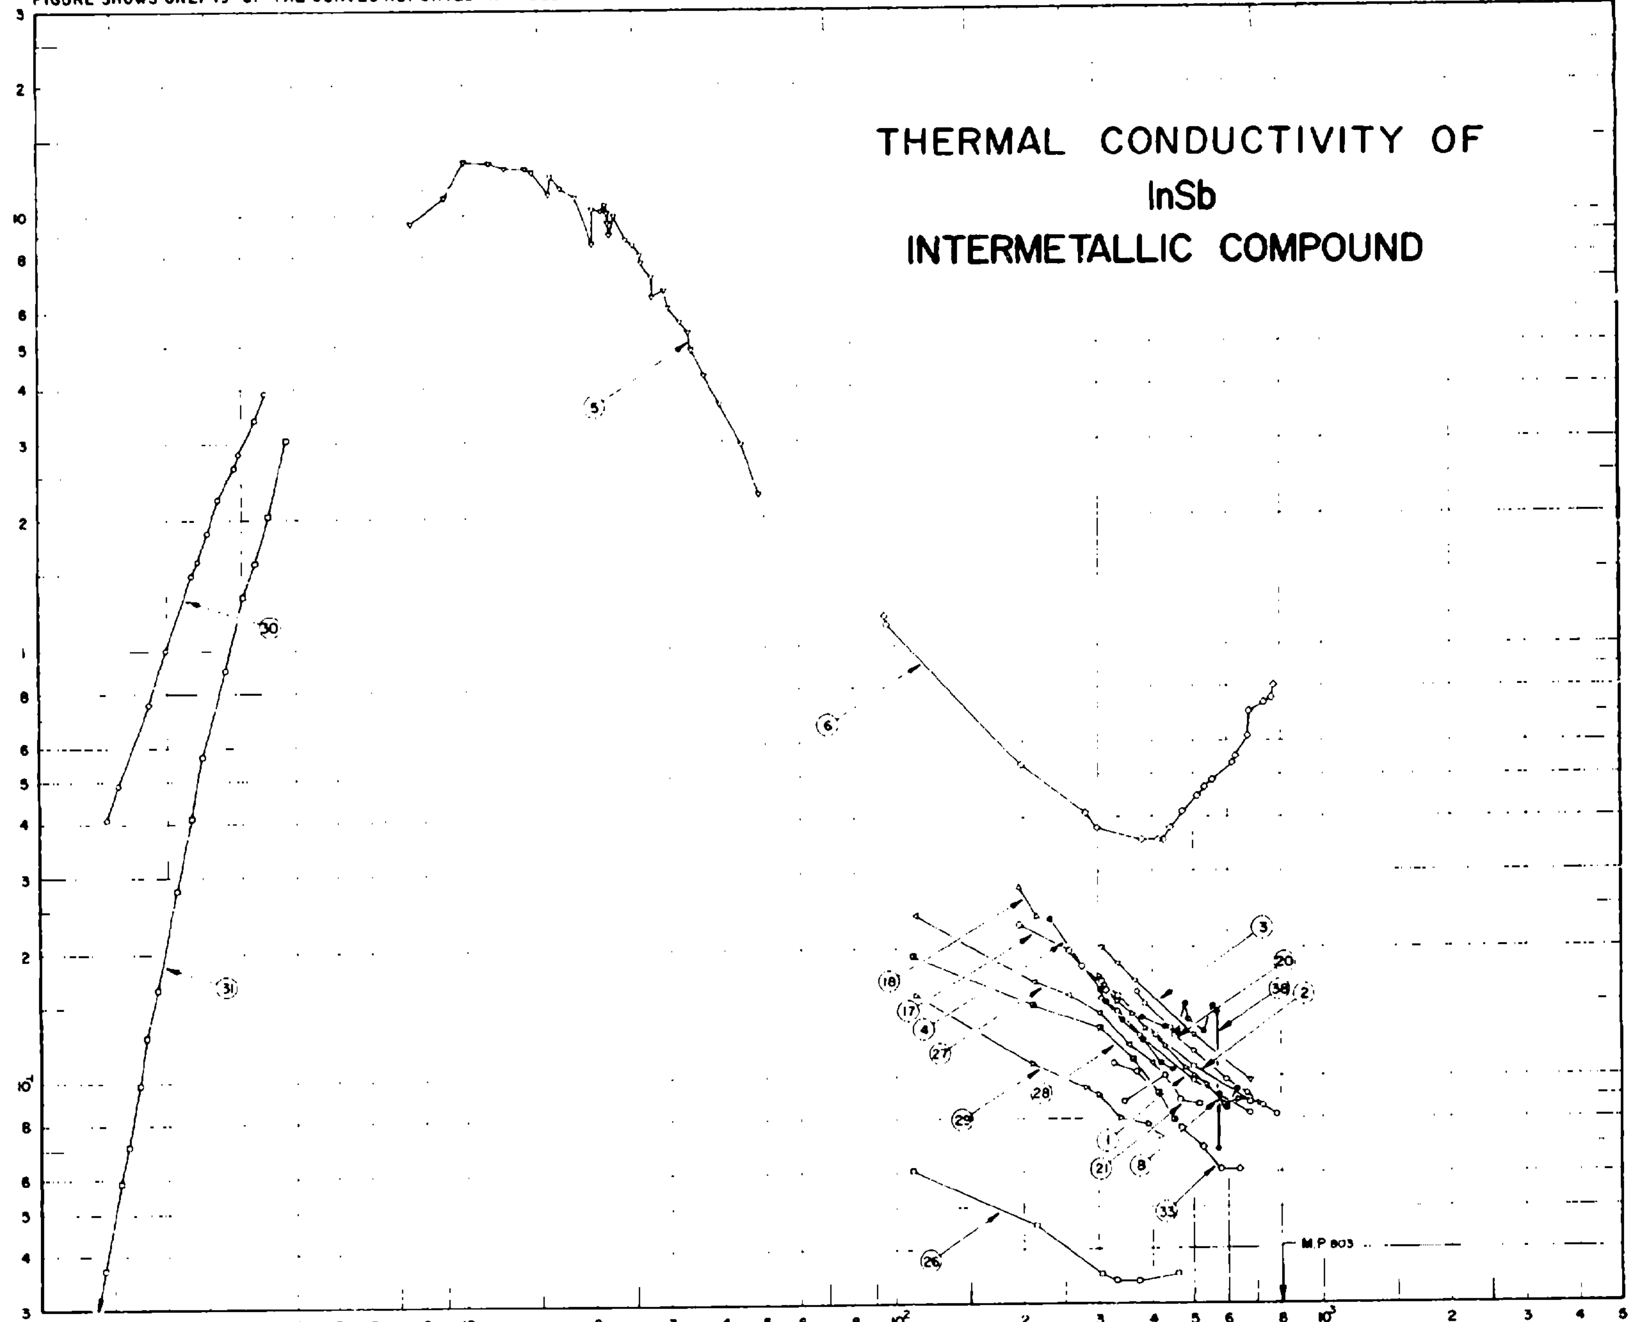

FIG 368

SPECIFICATION TABLE NO. 368 THERMAL CONDUCTIVITY OF InSb INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 368]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	309	C	1957	305-678	±10	InSb; A	p-type indium antimonide; single crystal; 2×10^{15} extrinsic electrons cm^{-3}, weakly degenerate over the temperature range; Firth Brown F.H. steel used as reference material.
2	309	C	1957	305-678	±10	InSb; B	n-type, single crystal; 10^{17} extrinsic electrons cm^{-3}, weakly degenerate over the temperature range; Firth Brown F.H. steel used as reference material.
3	309	C	1957	305-678	±10	InSb; C	n-type, single crystal, 2×10^{18} extrinsic electrons cm^{-3}, strongly degenerate near room temperature; Firth Brown F.H. steel used as reference material.
4	307	P	1959	232-446		InSb	Single crystal; 3×10^{17} electrons cm^{-3}, specific heat 12 cal mol^{-1}.
5	303	L	1959	7.5-49		InSb	p-type single crystal; impurity concentration 2.89×10^{17} cm^{-3} (from thermal conductivity data); electrical conductivity 14.1 ohm^{-1} cm^{-1} at 78 K.
6	302		1954	95-773		InSb	No details reported.
7			1958	330-770		InSb	No details reported.
8	590	P	1960	300-715		InSb; IS-194	Single crystal; rectangular parallepiped dimensions 1 1/2 x 3/8 x 3/8 in.
9	542	C	1962	308-443	±20	InSb; E-1	n-type single crystal; donor concentration 10^{16} cm^{-3}; specimen 12.3 mm dia, 7.2 mm long; measured in vacuo of 5×10^{-5} mm Hg.
10	542	C	1962	445-573	±20	InSb; S-1	Similar to the above specimen.
11	542	C	1962	406-575	±20	InSb; S-1	The above specimen measured in a magnetic field of 1000 gauss.
12	542	C	1962	406-575	±20	InSb; S-1	The above specimen measured in a magnetic field of 2000 gauss.
13	542	C	1962	406-575	±20	InSb; S-1	The above specimen measured in a magnetic field of 3000 gauss.
14	542	C	1962	406-575	±20	InSb; S-1	The above specimen measured in a magnetic field of 5000 gauss.
15	542	C	1962	448-575	±20	InSb; S-1	The above specimen measured in a magnetic field of 7000 gauss.
16	542	C	1962	406-575	±20	InSb; S-1	The above specimen measured in a magnetic field of 8000 gauss.
17	611	L	1959	196-667	± 4	InSb; We	p-type single crystal; dislocation concentration 1.6×10^{15} cm^{-3}, measured in vacuo of $< 5 \times 10^{-5}$ torr.
18	611	L	1959	196-667	± 4	InSb; Wd	n-type single crystal; dislocation concentration 1.2×10^{16} cm^{-3}, measured in vacuo of $< 5 \times 10^{-5}$ torr.
19	611	L	1959	339-526	± 4	InSb; Wb	p-type single crystal; dislocation concentration 3.3×10^{15} cm^{-3}, measured in vacuo of $< 5 \times 10^{-5}$ torr.
20	825		1958	368-781		InSb	No details reported.

SPECIFICATION TABLE NO. 368 THERMAL CONDUCTIVITY OF InSb INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 368]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
21	949	E	1965	345-518	12	InSb	n-type single crystal; donor concentration 5 x 10^{16} cm^{-3}; specimen 2.51 cm in dia and 0.27 cm thick; measured in vacuum of ≥ 5 x 10^{-5} torr; measured in a magnetic field of zero gauss.
22	949	E	1965	345-518	12	InSb	The above specimen measured in a magnetic field of 1000 gauss.
23	949	E	1965	345-518	12	InSb	The above specimen measured in a magnetic field of 2000 gauss.
24	949	E	1965	345-518	12	InSb	The above specimen measured in a magnetic field of 5000 gauss.
25	949	E	1965	345-518	12	InSb	The above specimen measured in a magnetic field of 8000 gauss.
26	950, 951	L	1963	110-459		InSb	Large crystals; prepared from highly pure indium and Sb-000 antimony purified by multiple-zone recrystallization, synthesized in evacuated (10^{-3} mm Hg) quartz ampoule, slowly cooled; carrier concentration 10^{16} cm^{-3}.
27	950, 951	L	1963	113-459		InSb	0.26 In_2Te_3; prepared from highly pure indium, Sb-000 antimony, and tellurium purified by multiple-zone recrystallization, synthesized in evacuated (10^{-3} mm Hg) quartz ampoule, slowly cooled.
28	950, 951	L	1963	111-452		InSb	0.77 In_2Te_3; same fabrication method as the above specimen.
29	950, 951	L	1963	112-419		InSb	1.28 In_2Te_3; same fabrication method as the above specimen.
30	952	L	1962	1.5-3.4	± 2	InSb;N	Tellurium added as impurity; n-type; carrier concentration reported at 77 K as 1.4 x 10^{17} carriers per cm^3; specimen 1.8 x 3.95 mm in. cross-section; cut from single crystals with axis normal to direction of growth; sandblasted.
31	952	L	1962	1.4-3.8	± 2	InSb;P	Germanium added as impurity; p-type; hole concentration reported at 77K as 2 x 10^{16} holes per cm^3; specimen 2.3 x 3.55 mm in. cross-section; cut from single crystal with axis normal to direction of growth; sandblasted.
32	953	C	1965	327,416		InSb;E-2	5 x 10^{19} Zr and 5 x 10^{19} Cd impurity atoms per cm^3; p-type; single crystal; specimen 12 mm in. dia and 7 mm -12 mm high; supplied by Exotic Materials Inc.; first set.
33	953	C	1965	325-640		InSb;E-2	Similar to the above specimen; second set.
34	953	C	1965	328-633		InSb;S-5	Similar to the above specimen except for 2 x 10^{18} Zr impurity atoms per cm^3; first set.
35	953	C	1965	325-494		InSb;S-5	Similar to the above specimen; second set.
36	953	C	1965	323-634		InSb,S-4A	Similar to the above specimen except for 1.3 x 10^{18} Zr impurity atoms per cm^3; first set.
37	953	C	1965	325-635		InSb,S-4A	Similar to the above specimen; second set.
38	953	C	1965	379-631		InSb,S-1	3.32 x 10^{18} Te impurity atoms per cm^3; n-type; single crystal; specimen 12 mm in. dia and 7 mm - 12 mm high; supplied by Merk and Co., Rahway, New Jersey; run 1.
39	953	C	1965	338-600		InSb,S-1	Similar to the above specimen; run 2.

SPECIFICATION TABLE NO. 369 THERMAL CONDUCTIVITY OF InAs INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 369]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	300	C	1958	301-1054	10	InAs	n-type; polycrystal; doped with extrinsic carriers of ~10^{18} cm^{-3}; the doping agent (sulphur) added in the form of an In + S alloy; high grade dense alumina (calibrated against Armco iron) used as the comparative material; data obtained from two specimens of the same specifications.
2	300	C	1958	302-1000	10	InAs	Similar to the above specimens but doped with 5 x 10^{16} extrinsic carriers.
3	519	L	1958	90-300	2-3	InAs	p-type; concentration of current carriers of the order of 10^{18} cm^{-3}; specimen ~5 mm in dia; synthesized from original materials in double evacuated quartz ampules, re-melted to obtain the right form with heating rate of 100 C per hr; purified by zone melting (impurity ~0.0001%).
4	578	C	1960	309-691	± 5	Indium Arsenide	Pure; polycrystal; electron concentration ~3 x 10^{16} cm^{-3}; F.H. stainless steel (checked by Armco iron) used as comparative material; data from three specimens.
5	578	C	1960	308-693	± 5	Indium Arsenide	Similar to the above specimens but sulphur doped to give an electron concentration of ~10^{19} cm^{-3}.

SPECIFICATION TABLE NO. 374 THERMAL CONDUCTIVITY OF PbTe INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 374]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	307	P	1959	112-647		PbTe	Single crystal; hole concentration 2 x 10^{18} cm^{-3}; thermal conductivity calculated from measurements of thermal diffusivity using specific heat values of Parkinson and Quarrington at temperatures higher than room condition, and using 12 cal $mole^{-1}$ for temperatures less than room condition.
2	380	P	1958	150-700		PbTe	Data determined by the same method (improved) as the above.
3	381, 329	L	1957	193-302		PbTe	Polycrystal; electrical conductivity at room temperature, σ = 60 ohm^{-1} cm^{-1}.
4	381, 329	L	1957	170-300		PbTe	Similar to the above specimen but σ = 1740 ohm^{-1} cm^{-1}.
5	381, 329	L	1957	92-446		PbTe	Similar to the above specimen but σ = 1200 ohm^{-1} cm^{-1}.
6	381, 329	L	1957	90-440		PbTe	Similar to the above specimen but σ = 430 ohm^{-1} cm^{-1}.
7	381, 329	L	1957	79-344		PbTe	Similar to the above specimen but σ = 60 ohm^{-1} cm^{-1}.
8	548	L	1961	350-700		PbTe	p-type; density 8.15 g cm^{-3}.
9	548	L	1961	350-700		PbTe	n-type; density 8.15 g cm^{-3}.
10	554	L	1966	106-451		PbTe	p-type stoichiometric single crystal; prepared by melting 99.999 pure Pb and Te in a 6 mm dia quartz phial (to which a 1 mm dia x 15 mm long capillary was attached) under a vacuum of 10^{-2} Torr at 1000 C for 100 hrs, annealed at 200 C for 4 to 8 hrs; electrical resistivity reported as 0.0114, 0.0123, 0.0142, 0.0160, 0.0187, 0.0230, 0.0270, 0.0324, 0.0476, 0.0622, 0.0735, 0.0963, 0.119, 0.146, 0.174, 0.220, 0.277, 0.312, 0.365, 0.407, 0.406, and 0.219 ohm cm at 113, 122, 132, 153, 173, 191, 211, 234, 275, 301, 313, 336, 357, 382, 394, 415, 450, 478, 493, 508, 658, and 794 K respectively.

SPECIFICATION TABLE NO. 381 THERMAL CONDUCTIVITY OF $MoSi_2$ INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 381]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	575		1954	424-1517		$MoSi_2$	Supplied by General Electric Co.; run No. 1.
2	575		1954	426-1513		$MoSi_2$	The above specimen; run No. 2.
3	576	C	1954	449-1074	<5	$MoSi_2$; 1-tc	Hot pressed; 0.5 in. dia; supplied by NACA; density 6.08 g cm^{-3}; stainless steel used as standard.
4	576	C	1954	471-1097	<5	$MoSi_2$; 2-tc	Similar to the above except density 6.02 g cm^{-3}.
5	614	R	1961	437-2058	<5	$MoSi_2$	Slip cast; 1 in. dia, 1 in. thick; density 5.80 g cm^{-3}; measured in a He atmosphere.
6	576	C	1954	449-1074	<5	$MoSi_2$; 1-tc	Molybdenum disilicide; 62.0 Mo, 36.3 Si, 1.0 Fe, and 0.8 O; furnished by NACA; hot-pressed; density 6.08 g cm^{-3} (97.5% of theoretical density); stainless steel used as comparative material.
7	576	C	1954	471-1097	<5	$MoSi_2$; 2-tc	Similar to the above specimen except density 6.02 g cm^{-3} (96.5% of theoretical density).
8	571	L	1954	607-1062	10	$MoSi_2$; 5-tc	Molybdenum disilicide; 62.0 Mo, 36.3 Si, 0.8 Fe, 0.5 O, 0.34 N, and 0.17 C; specimen 3.5 in. long and 0.5 in. in dia; supplied by Lewis Flight Propulsion Lab; density 6.12 g cm^{-3} (98% of theoretical density).
9	572	C	1950	404-840		$MoSi_2$	Molybdenum disilicide; 62.4-62.8 Mo, 36.6-36.7 Si, and 0.5-1.0 Te; estimated composition; specimen 0.5 in. in dia and 7 in. long; hot-pressed from nonuniform powder and etched with a solution containing 17% HCl and 8% HNO_3 for 70 min; density ~5.91 g cm^{-3}; nickel used as comparative material.

SPECIFICATION TABLE NO. 388 THERMAL CONDUCTIVITY OF Ag_2Se INTERMETALLIC COMPOUNDS

[For Data Reported in Figure and Table No. 388]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	551	L	1960	288-373		Ag_2Se	Stoichiometric crystalline; 12 mm dia x 19.1 mm long; prepared from 99.999+ Se and 99.99+ Ag from American Smelting and Refining Co., melted in carbon coated quartz tube, evacuated at ~ 10^{-5} mm Hg heated at 1050 ~ 1100 C for 16 hrs; electrical resistivity 10.2 ohm cm.
2	963	L	1962	199-385	5	Ag_2Se;S1	Polycrystalline; prepared by melting appropriate amounts of pure elements in a quartz tube, floating zone melting in a graphite boat under controlled vapor pressure at a speed of 0.5 mm min^{-1} for about 25 passages, slowly cooled 15 ~ 10 degree h^{-1}, to 150 C, then cooled at 1 ~ 2 degree h^{-1} through the transition temperature (133 C), below the transition temperature the specimen annealed for several hrs; carrier concentration 1.2×10^{18} cm^{-3}; electrical resistivity reported as 0.468 ~ 1.98 milliohm cm in the range 85.8 ~ 621.1 K.
3	963	L	1962	84-389	5	Ag_2Se;H1	Polycrystalline; same fabrication method as the above specimen; carrier concentration 1.5×10^{18} cm^{-3}; electrical resistivity reported as 0.462 ~ 1.33 milliohm cm in the range 85.6 ~ 632.9 K.
4	963	L	1962	80-585	5	Ag_2Se;H2	Polycrystalline; same fabrication method as the above specimen; carrier concentration 5.7×10^{17} cm^{-3}; electrical resistivity reported as 0.533 ~ 2.89 milliohm cm in the range 80.4 ~ 645.2 K.
5	963	L	1962	112-588	5	Ag_2Se;H3	Polycrystalline; same fabrication method as the above specimen; carrier concentration 1.2×10^{18} cm^{-3}.
6	963	L	1962	80-395	5	Ag_2Se;F1	Polycrystalline; same fabrication method as the above specimn, carrier concentration 1.0×10^{18} cm^{-3}.
7	943	L	1963	315-451		Ag_2Se	n-type; specimen 8 mm in dia and 12-14 mm long; synthesized in evacuated quartz ampule at 10^{-4} mm Hg, heated to above the melting point of the component with higher melting point for 2 hrs, then heated to the melting point of the compound for 8 hrs; annealed at 700-800C for several hrs and then cooled to room temperature.

SPECIFICATION TABLE NO. 408 THERMAL CONDUCTIVITY OF (Sb_2Te_3 + Bi_2Te_3) MIXTURES

(Sb_2Te_3 + Bi_2Te_3) > 95.0%; impurity < 2.0% each)

[For Data Reported in Figure and Table No. 408]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sb_2Te_3	Bi_2Te_3	Composition (continued), Specifications and Remarks
1	832		1962	303.2		$Sb_{1.8}Bi_{0.2}Te_3$	87.6	12.4	p-type; prepared by using the powder metallurgical techniques, pressed and sintered; heat flow perpendicular to the pressing direction.
2	832		1962	303.2		$Sb_{1.7}Bi_{0.3}Te_3$	80.1	19.9	Similar to the above specimen.
3	332		1962	303.2		$Sb_{1.6}Bi_{0.4}Te_3$	75.8	24.2	Similar to the above specimen.
4	832		1962	303.2		$Sb_{1.5}Bi_{0.5}Te_3$	70.1	29.9	Similar to the above specimen.
5	936	T	1965	298.2		$Sb_{1.2}Bi_{0.8}Te_{3.13}$	52.73	44.94	2.33 Te (calculated) p-type; specimen size 0.5 x 0.5 x 1 cm; prepared from 99.999 pure Bi and Sb supplied by Consolidated Mining and Smelting Co., and from 99.97 pure Te supplied by Canadian Copper Refiners Ltd., materials weighed out, crushed, sealed in an ampule in a vacuum of 10^{-5} Torr, heated at 900 C for 20 hrs, rocked, cooled, then zone-melted at a rate of 0.07 ~0.28 in. hr^{-1}, cooled and cut; thermal conductivity data calculated from measured values of figure of merit, Seebeck coefficient, and electrical conductivity; electrical conductivity reported as 0.83 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
6	936	T	1965	164-357		$Sb_{1.2}Bi_{0.8}Te_{3.13}$	52.73	44.94	p-type; same fabrication method and measuring method as 2.33 Te (calculated); the above specimen; electrical resistivity reported as 0.116, 0.121, 0.135, 0.156, 0.185, 0.225, 0.259, 0.284, 0.315, 0.252, and 0.356 milliohm cm at 166, 172, 185, 203, 221, 245, 267, 282, 301, 333, and 357 K, respectively.
7	936	T	1965	298.2		$Sb_{1.33}Bi_{0.67}Te_{3.13}$	59.56	38.07	2.37 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.77 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
8	936	T	1965	298.2		$Sb_{1.33}Bi_{0.67}Te_{3.13}$			Cut from the same ingot as the above specimen; electrical conductivity reported on 0.69 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
9	936	T	1965	172-351		$Sb_{1.33}Bi_{0.67}Te_{3.13}$			Same composition, fabrication method, and measuring method as the above specimen; electrical resistivity 0.472, 0.509, 0.661, 0.791, 0.910, 1.10, 1.41, 1.76, 1.95, and 2.04 milliohm cm at 173, 185, 212, 232, 248, 269, 301, 335, 351, and 360 K, respectively.
10	936	T	1965	298.2		$Sb_{1.4}Bi_{0.6}Te_{3.13}$	63.06	34.55	2.39 Te (calculated); p-type; some fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.83 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.

SPECIFICATION TABLE NO. 403 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sb_2Te_3	Bi_2Te_3	Composition (continued), Specifications and Remarks
11	936	T	1965	298.2		$Sb_{1.4}Bi_{0.6}Te_{3.13}$			Cut from the same ingot as the above specimen; electrical conductivity reported as 0.89 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
12	936	T	1965	298.2		$Sb_{1.4}Bi_{0.6}Te_{3.13}$			Similar to the above specimen except electrical conductivity reported as 0.87 x10^3 $ohm^{-1}cm^{-1}$ at room temperature.
13	936	T	1965	158-360		$Sb_{1.4}Bi_{0.6}Te_{3.13}$			Similar to the above specimen except electrical resistivity reported as 0.354, 0.408, 0.467, 0.637, 0.776, 0.917, 1.17, 1.45, and 1.65 milliohm cm at 159, 178, 192, 224, 251, 273, 305, 337, and 357 K, respectively.
14	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.13}$	68.42	29.16	2.42 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.13 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
15	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.13}$			Another run of the above specimen; electrical conductivity reported as 1.39 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
16	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.13}$	68.42	29.16	2.42 Te (calculated); cut from the same ingot as the above specimen; electrical conductivity reported as 1.18 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
17	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.13}$	68.42	29.16	2.42 Te (calculated); similar to the above specimen except electrical conductivity reported as 1.22 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
18	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.13}$			Similar to the above specimen except electrical conductivity reported as 1.17 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
19	936	T	1965	158-358		$Sb_{1.5}Bi_{0.}Te$	68.42	29.16	2.42 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical resistivity reported as 0.269, 0.306, 0.376, 0.461, 0.539, 0.689, 0.746, 0.859, 1.00, and 1.19 milliohm cm at 159, 173, 197, 219, 237, 269, 281, 301, 329, and 352 K, respectively.
20	936	T	1965	298.2		$Sb_{1.6}Bi_{0.4}Te_{3.13}$	73.92	23.63	2.45 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.73 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.

SPECIFICATION TABLE NO. 408 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sb_2Te_3	Bi_2Te_3	Composition (continued), Specifications and Remarks
21	936	T	1965	298.2		$Sb_{1.6}Bi_{0.4}Te_{3.13}$	73.92	23.63	2.45 Te (calculated); cut from the same ingot as the above specimen; electrical conductivity reported as 1.92×10^3 ohm^{-1} cm^{-1} at room temperature.
22	936	T	1965	298.2		$Sb_{1.6}Bi_{0.4}Te_{3.13}$	73.92	23.63	2.45 Te (calculated); similar to the above specimen except electrical conductivity reported as 1.82×10^3 ohm^{-1} cm^{-1} at room temperature.
23	936	T	1965	168-353		$Sb_{1.6}Bi_{0.4}Te_{3.13}$	73.92	23.63	2.45 Te (calculated); similar to the above specimen except electrical resistivity reported as 0.210, 0.220, 0.255, 0.293, 0.337, 0.400, 0.462, 0.513, 0.618, and 0.692 milliohm cm at 169, 176, 195, 213, 232, 256, 282, 300, 335, and 354 K, respectively.
24	936	T	1965	298.2		$Sb_{1.8}Bi_{0.2}Te_{3.13}$	85.36	12.13	2.51 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 2.44×10^3 ohm^{-1} cm^{-1} at room temperature.
25	936	T	1965	298.2		$Sb_{1.8}Bi_{0.2}Te_{3.13}$			Cut from the same ingot as the above specimen; electrical conductivity reported as 3.12×10^3 ohm^{-1} cm^{-1} at room temperature.
26	936	T	1965	167-356		$Sb_{1.8}Bi_{0.2}Te_{3.13}$			Similar to the above specimen; electrical resistivity reported as 0.136, 0.150, 0.168, 0.188, 0.207, 0.229, 0.272, 0.304, 0.356, and 0.388 milliohm cm at 168, 183, 200, 217, 233, 255, 284, 304, 337, and 354 K, respectively.
27	936	T	1965	298.2		$Sb_{1.4}Bi_{0.6}Te_{3.08}$	63.88	35.00	1.12 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.15×10^3 ohm^{-1} cm^{-1} at room temperature.
28	936	T	1965	298.2		$Sb_{1.4}Bi_{0.6}Te_{3.19}$	62.37	34.18	3.45 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.85×10^3 ohm^{-1} cm^{-1} at room temperature.

SPECIFICATION TABLE NO. 408 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Sb_2Te_3	Bi_2Te_3	Composition (continued), Specifications and Remarks
29	936	T	1965	298.2		$Sb_{1.4}Bi_{0.6}Te_{3.26}$	61.59	23.75	4.66 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.88 x 10^3 ohm^{-1} cm^{-1} at room temperature.
30	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_3$	70.12	29.88	p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 3.22 x 10^3 ohm^{-1} cm^{-1} at room temperature.
31	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.06}$	69.32	29.55	1.13 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.72 x 10^3 ohm^{-1} cm^{-1} at room temperature.
32	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.19}$	67.67	28.84	3.49 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.24 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
33	936	T	1965	298.2		$Sb_{1.5}Bi_{0.5}Te_{3.26}$	66.81	28.47	4.72 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.19 x 10^3 ohm^{-1} cm^{-1} at room temperature.
34	936	T	1965	298.2		$Sb_{1.6}Bi_{0.4}Te_{3.06}$	74.91	23.94	1.15 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.52 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
35	935	T	1965	298.2		$Sb_{1.6}Bi_{0.4}Te_{3.19}$	73.10	23.36	3.54 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.74 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
36	936	T	1965	298.2		$Sb_{1.6}Bi_{0.4}Te_{3.26}$	72.16	23.06	4.78 Te (calculated); p-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.78 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.

SPECIFICATION TABLE NO. 410 THERMAL CONDUCTIVITY OF (Bi_2Te_3 + Sb_2Te_3) MIXTURES

(Bi_2Te_3 + Sb_2Te_3 ≥ 95.0%; impurity ≤ 2.0% each)

[For Data Reported in Figure and Table No. 410]

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Bi_2Te_3	Sb_2Te_3	Composition (continued), Specifications and Remarks
1	936	-	1965	298.2		$Bi_{1.75}Sb_{0.25}Te_{3.13}$	88.07	9.84	2.09 Te (calculated); n-type; 0.5 x 0.5 x 1 cm; prepared from 99.999 pure Bi and Sb supplied by Consolidated Mining and Smelting Co., and 99.97 pure Te supplied by Canadian Copper Refiners Ltd., materials weighed out, crushed, sealed in an ampule in a vacuum of 10^{-5} Torr, heated at 900 C for 20 hrs, rocked, cooled, zone-melted at a rate of 0.07-0.28 in. hr^{-1}, cooled and cut; thermal conductivity data calculated from measured values of figure of merit, Seebeck coefficient, and electrical conductivity; electrical conductivity reported as 1.19×10^3 $ohm^{-1}cm^{-1}$ at room temperature.
2	936	T	1965	298.2		$Bi_{1.75}Sb_{0.25}Te_{3.13}$			Cut from the same ingot as the above specimen; electrical conductivity reported as 1.39×10^3 $ohm^{-1}cm^{-1}$ at room temperature.
3	936	T	1965	298.2		$Bi_{1.75}Sb_{0.25}Te_{3.13}$			Similar to the above specimen except electrical conductivity reported as 1.20×10^3 $ohm^{-1}cm^{-1}$ at room temperature.
4	936	T	1965	163-362		$Bi_{1.75}Sb_{0.25}Te_{3.13}$			Similar to the above specimen except electrical resistivity reported as 311, 340, 423, 524, 579, 721, and 912 µohm cm at 163, 175, 209, 240, 259, 302, and 361 K, respectively.
5	936	T	1965	298.2		$Bi_{1.5}Sb_{0.5}Te_{3.13}$	77.62	20.24	2.14 Te (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.7×10^3 $ohm^{-1}cm^{-1}$ at room temperature.
6	936	T	1965	298.2		$Bi_{1.5}Sb_{0.5}Te_{3.13}$			Cut from the same ingot as the above specimen; electrical conductivity reported as 0.75×10^3 $ohm^{-1}cm^{-1}$ at room temperature.
7	936	T	1965	162-353		$Bi_{1.5}Sb_{0.5}Te_{3.13}$			Similar to the above specimen except electrical resistivity reported as 0.622, 0.643, 0.736, 0.843, 0.937, 1.03, 1.20, 1.31, and 1.55 milliohm cm at 164, 173, 191, 212, 232, 248, 278, 299, and 352 K, respectively.
8	936	T	1965	298.2		$Bi_{1.33}Sb_{0.67}Te_{3.13}$	70.32	27.50	2.18 Te (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.70×10^3 $ohm^{-1}cm^{-1}$ at room temperature.

SPECIFICATION TABLE NO. 410 (continued)

Curve No.	Ref. No.	Method Used	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent) Bi_2Te_3	Sb_2Te_3	Composition (continued), Specifications and Remarks
9	936	T	1965	164-356		$Bi_{1.33}Sb_{0.67}Te_{3.13}$			Similar to the above specimen except electrical resistivity reported as 0.689, 0.766, 0.853, 0.946, 1.10, 1.15, 1.32, 1.43, and 1.71 milliohm cm at 164, 179, 200, 220, 240, 252, 280, 301, and 354 K, respectively.
10	936	T	1965	298.2		$BiSbTe_{3.13}$	54.84	42.89	2.27 Te (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.43 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
11	936	T	1965	298.2		$BiSbTe_{3.13}$			Another run of the above specimen.
12	936	T	1965	170-355		$BiSbTe_{3.13}$			Similar to the above specimen except electrical resistivity reported as 1.27, 1.32, 1.49, 1.63, 1.80, 1.95, 2.24, 2.38, and 2.56 milliohm at 171, 181, 203, 218, 233, 250, 280, 302, and 356 K, respectively.
13	936	T	1965	298.2		$Bi_{1.75}Sb_{0.25}Te_{3.1}$	88.50	9.89	1.61 Te (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 0.93 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
14	936	T	1965	298.2		$Bi_{1.75}Sb_{0.25}Te_{3.19}$	87.24	9.75	3.11 Te (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.41 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.
15	936	T	1965	298.2		$Bi_{1.75}Sb_{0.25}Te_{3.26}$	86.28	9.64	4.08 Te (calculated); n-type; same fabrication method and measuring method as the above specimen; electrical conductivity reported as 1.46 x 10^3 $ohm^{-1}cm^{-1}$ at room temperature.

Material Index

MATERIAL INDEX TO THERMAL CONDUCTIVITY COMPANION VOLUMES 1, 2, AND 3

Material Name	Vol.	Page
Bricks (continued)		
Corundum	2	454, 905
Dense	2	443, 904
Dense fireclay	2	403
Diatomaceous	2	890, 891
Diatomaceous insulating	2	906, 907
Dinas	2	891
Egyptian fire clay	2	491, 901
Fire	2	491, 891, 895, 902, 903
Fireclay	2	403, 404, 490, 491, 896, 901, 903
Fire clay, dense	2	903
Fire clay, superduty	2	890
Georgia fire	2	896
Hand-burned face	2	891
High temp. insulating	2	891
High temp. insulating blast furnace	2	488, 899
Hytex hydraulic pressed building	2	896
Insulating	2	443, 891, 904
Insulating fire	2	891
Kaolin fire	2	404, 405, 904
Kaolin insulating refractory	2	895
Light weight	2	488, 489, 892, 899, 900
Lime sand	2	892

Material Name	Vol.	Page
Bricks (continued)		
Magnesia	2	485, 897, 898, 899
Magnesite	2	478, 485, 892, 895, 905
Magnesite fire	2	897
Magnezit	2	899, 902
Marksa	2	893
Metallurgical	2	892, 893
Metallurgical porous	2	893
Mica	2	892
Missouri fire	2	492, 905
Normal	2	488, 489, 900, 901
Ordzhonikidze	2	899
Penn. fire	2	905
Porous	2	894
Porous concrete	2	894
Porous fire (Italy)	2	895
Red	2	405, 492, 895
Red, hard burned	2	896
Red, soft burned	2	896
Red shamotte	2	405
Refractory insulating	2	892
Refractory insulating common chamotte	2	892
Shamotte	2	492, 894, 898
Shamotte, white	2	405
Silica	2	408, 489, 492, 502, 894, 896,
